

Impacts of Climate Change, Pt. 1

EES 3310/5310
Global Climate Change
Jonathan Gilligan
Class #21: Friday, March 12 2021

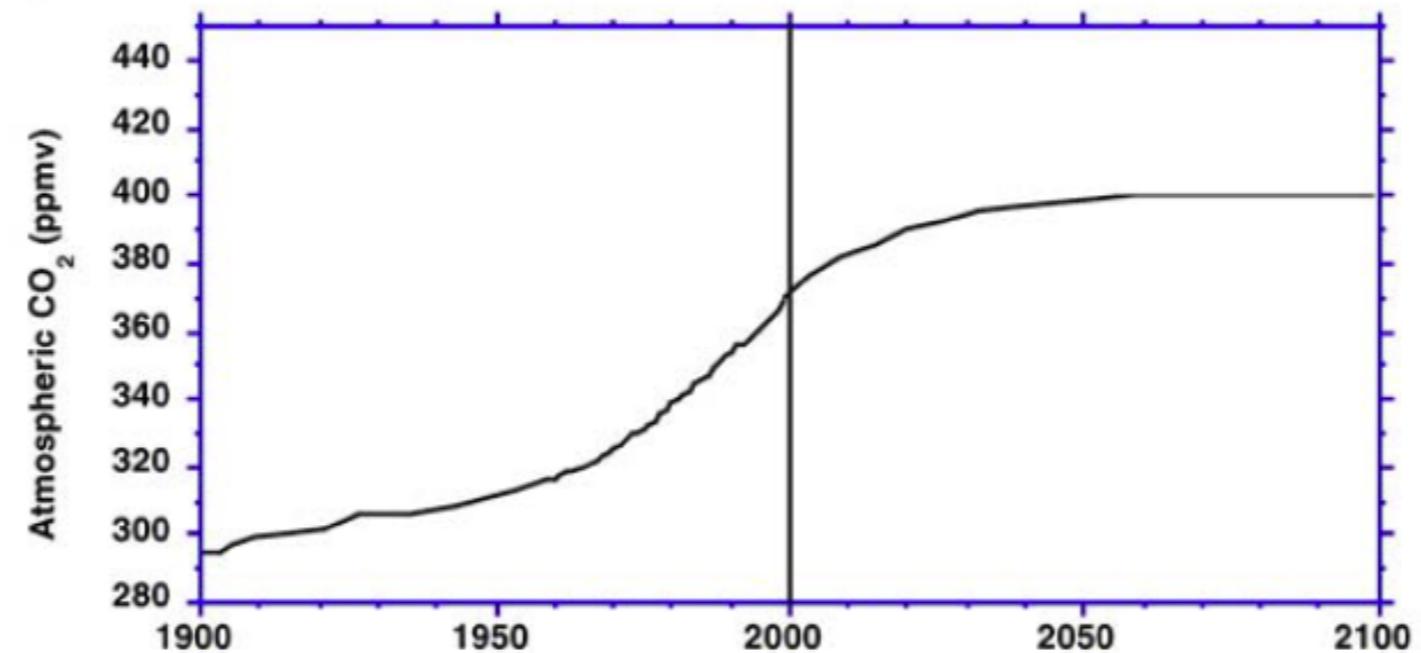

Bathtub model

Bathtub model

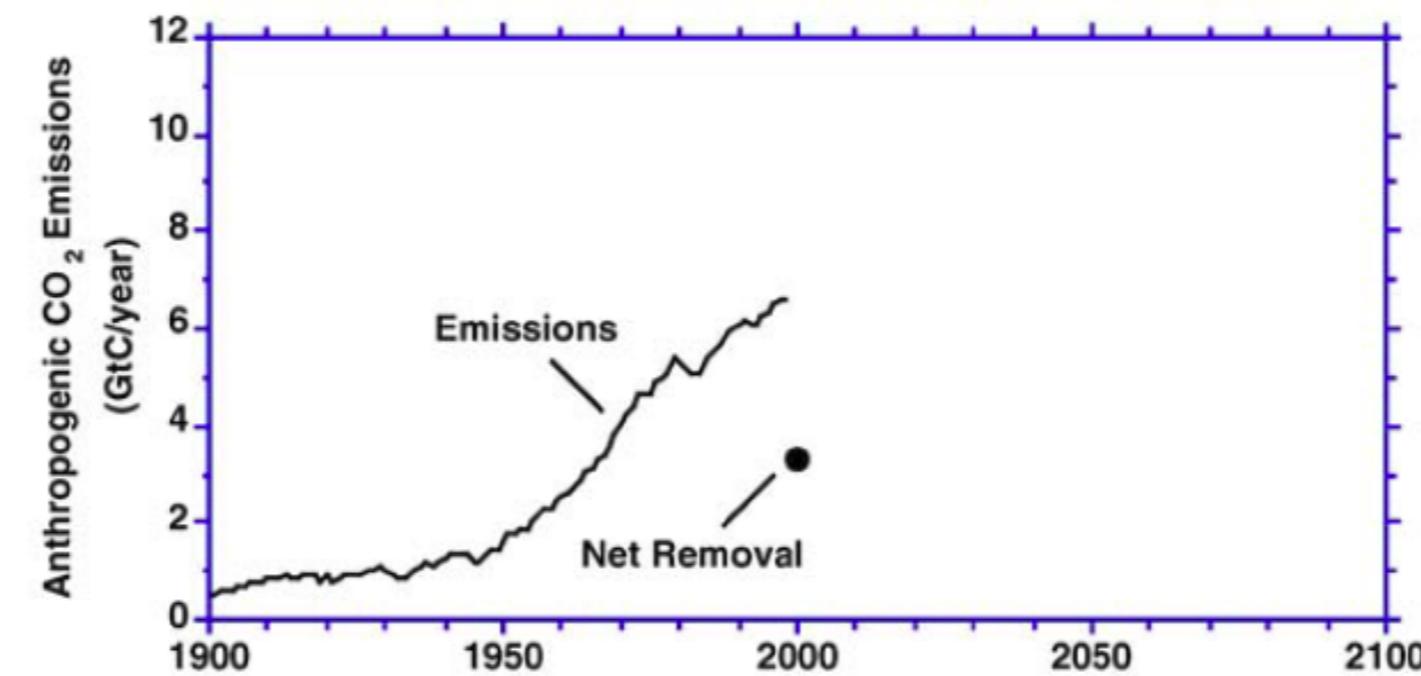

Bathtub model

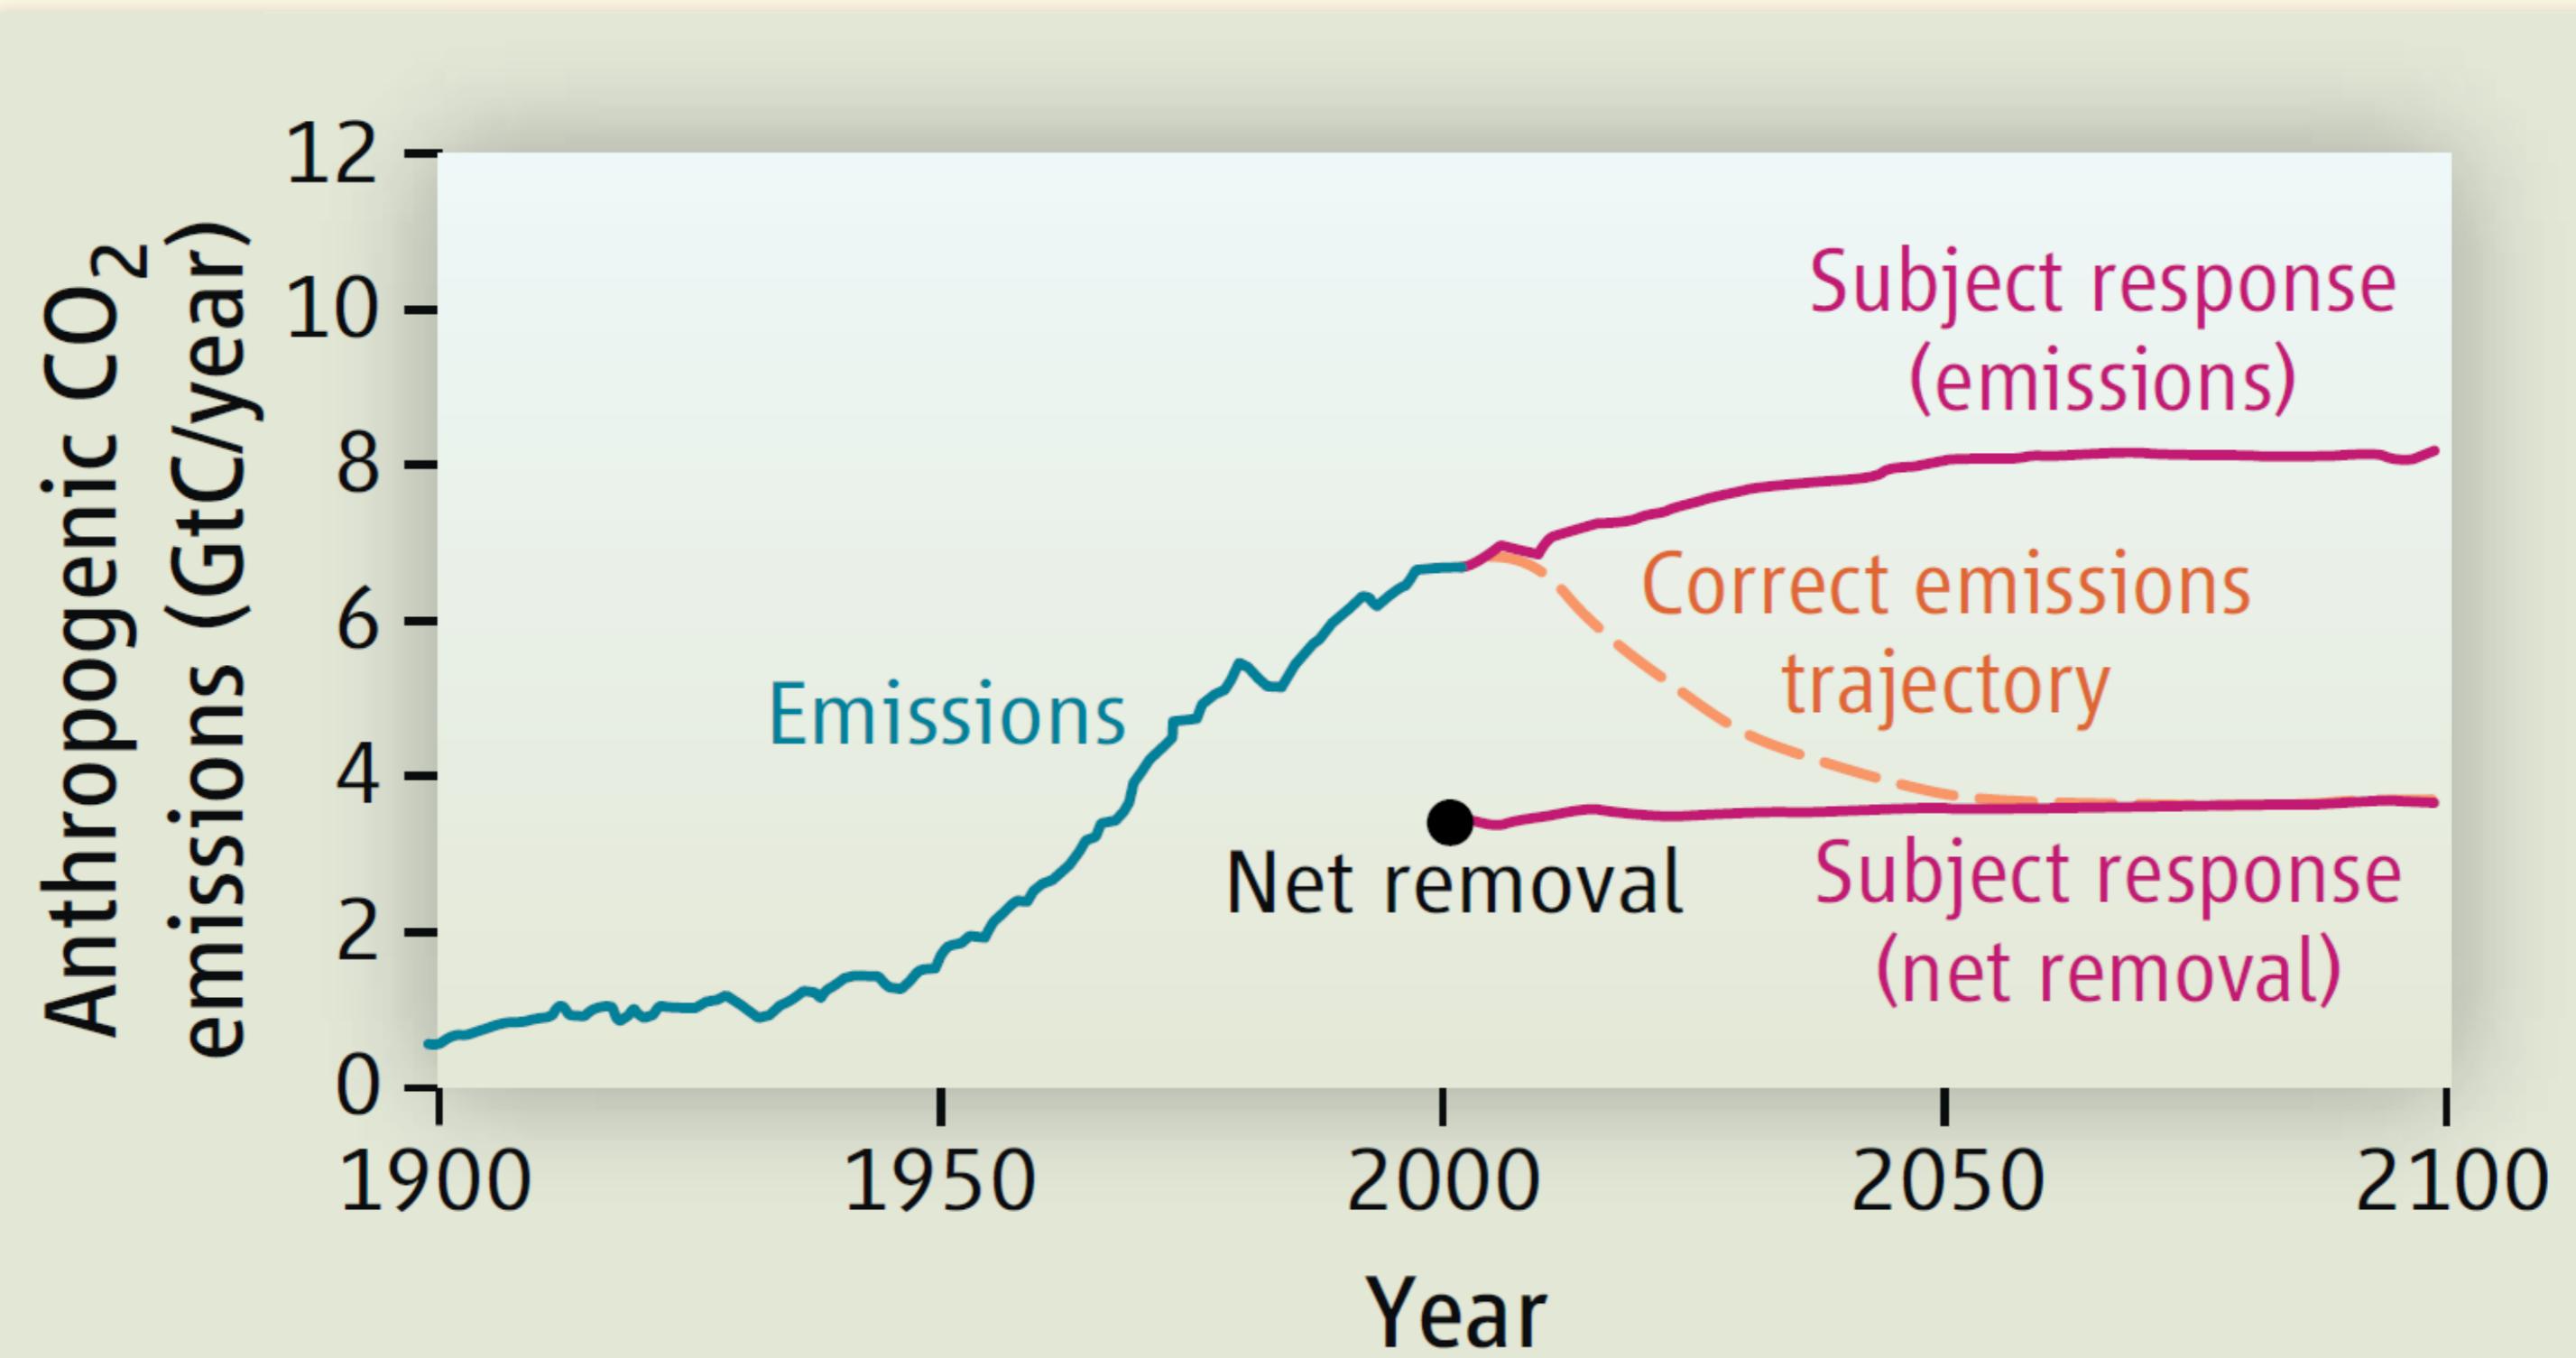

Now consider a scenario in which the concentration of CO₂ in the atmosphere gradually rises to 400 ppm, about 8% higher than the level today, then stabilizes by the year 2100, as shown here:

1. The graph below shows anthropogenic CO₂ emissions from 1900-2000, and current net removal of CO₂ from the atmosphere by natural processes. Sketch:
 - a. Your estimate of likely future net CO₂ removal, given the scenario above.
 - b. Your estimate of likely future anthropogenic CO₂ emissions, given the scenario above.

Bathtub model

J.D. Sterman, Science 322, 532 (2008).

- 212 MIT MBA and graduate students.
- 60% majored in science or engineering

Framework for Thinking about Climate Change

Sources of Vulnerability

Types of systems:

- Managed Systems
- Unmanaged Systems
- Unmanageable
- Examples?

Systems

Extensively Managed	Partially Managed	Unmanageable
<ul style="list-style-type: none">• Most economic sectors:<ul style="list-style-type: none">■ <i>Manufacturing</i>■ <i>Health care</i>• Most human activities:<ul style="list-style-type: none">■ <i>Sleeping</i>■ <i>Surfing the Internet</i>	<ul style="list-style-type: none">• Vulnerable economic sectors:<ul style="list-style-type: none">■ <i>Agriculture</i>■ <i>Forestry</i>• Nonmarket systems:<ul style="list-style-type: none">■ <i>Beaches and coastal ecosystems</i>■ <i>Wildfires</i>	<ul style="list-style-type: none">• <i>Hurricanes</i>• <i>Sea-level rise</i>• <i>Ocean acidification</i>

Managed, Unmanaged, & Unmanageable Systems

- Relevance?
 - Climate impacts?
- Transformations:
 - Unmanaged → managed
 - Unmanageable → manageable
- “Focal Policy”
 - What is it?
 - Examples?
 - Advantages and disadvantages?

Scientific Uncertainty

- Nordhaus:

"A sensible policy would pay an insurance premium to avoid playing the roulette wheel."

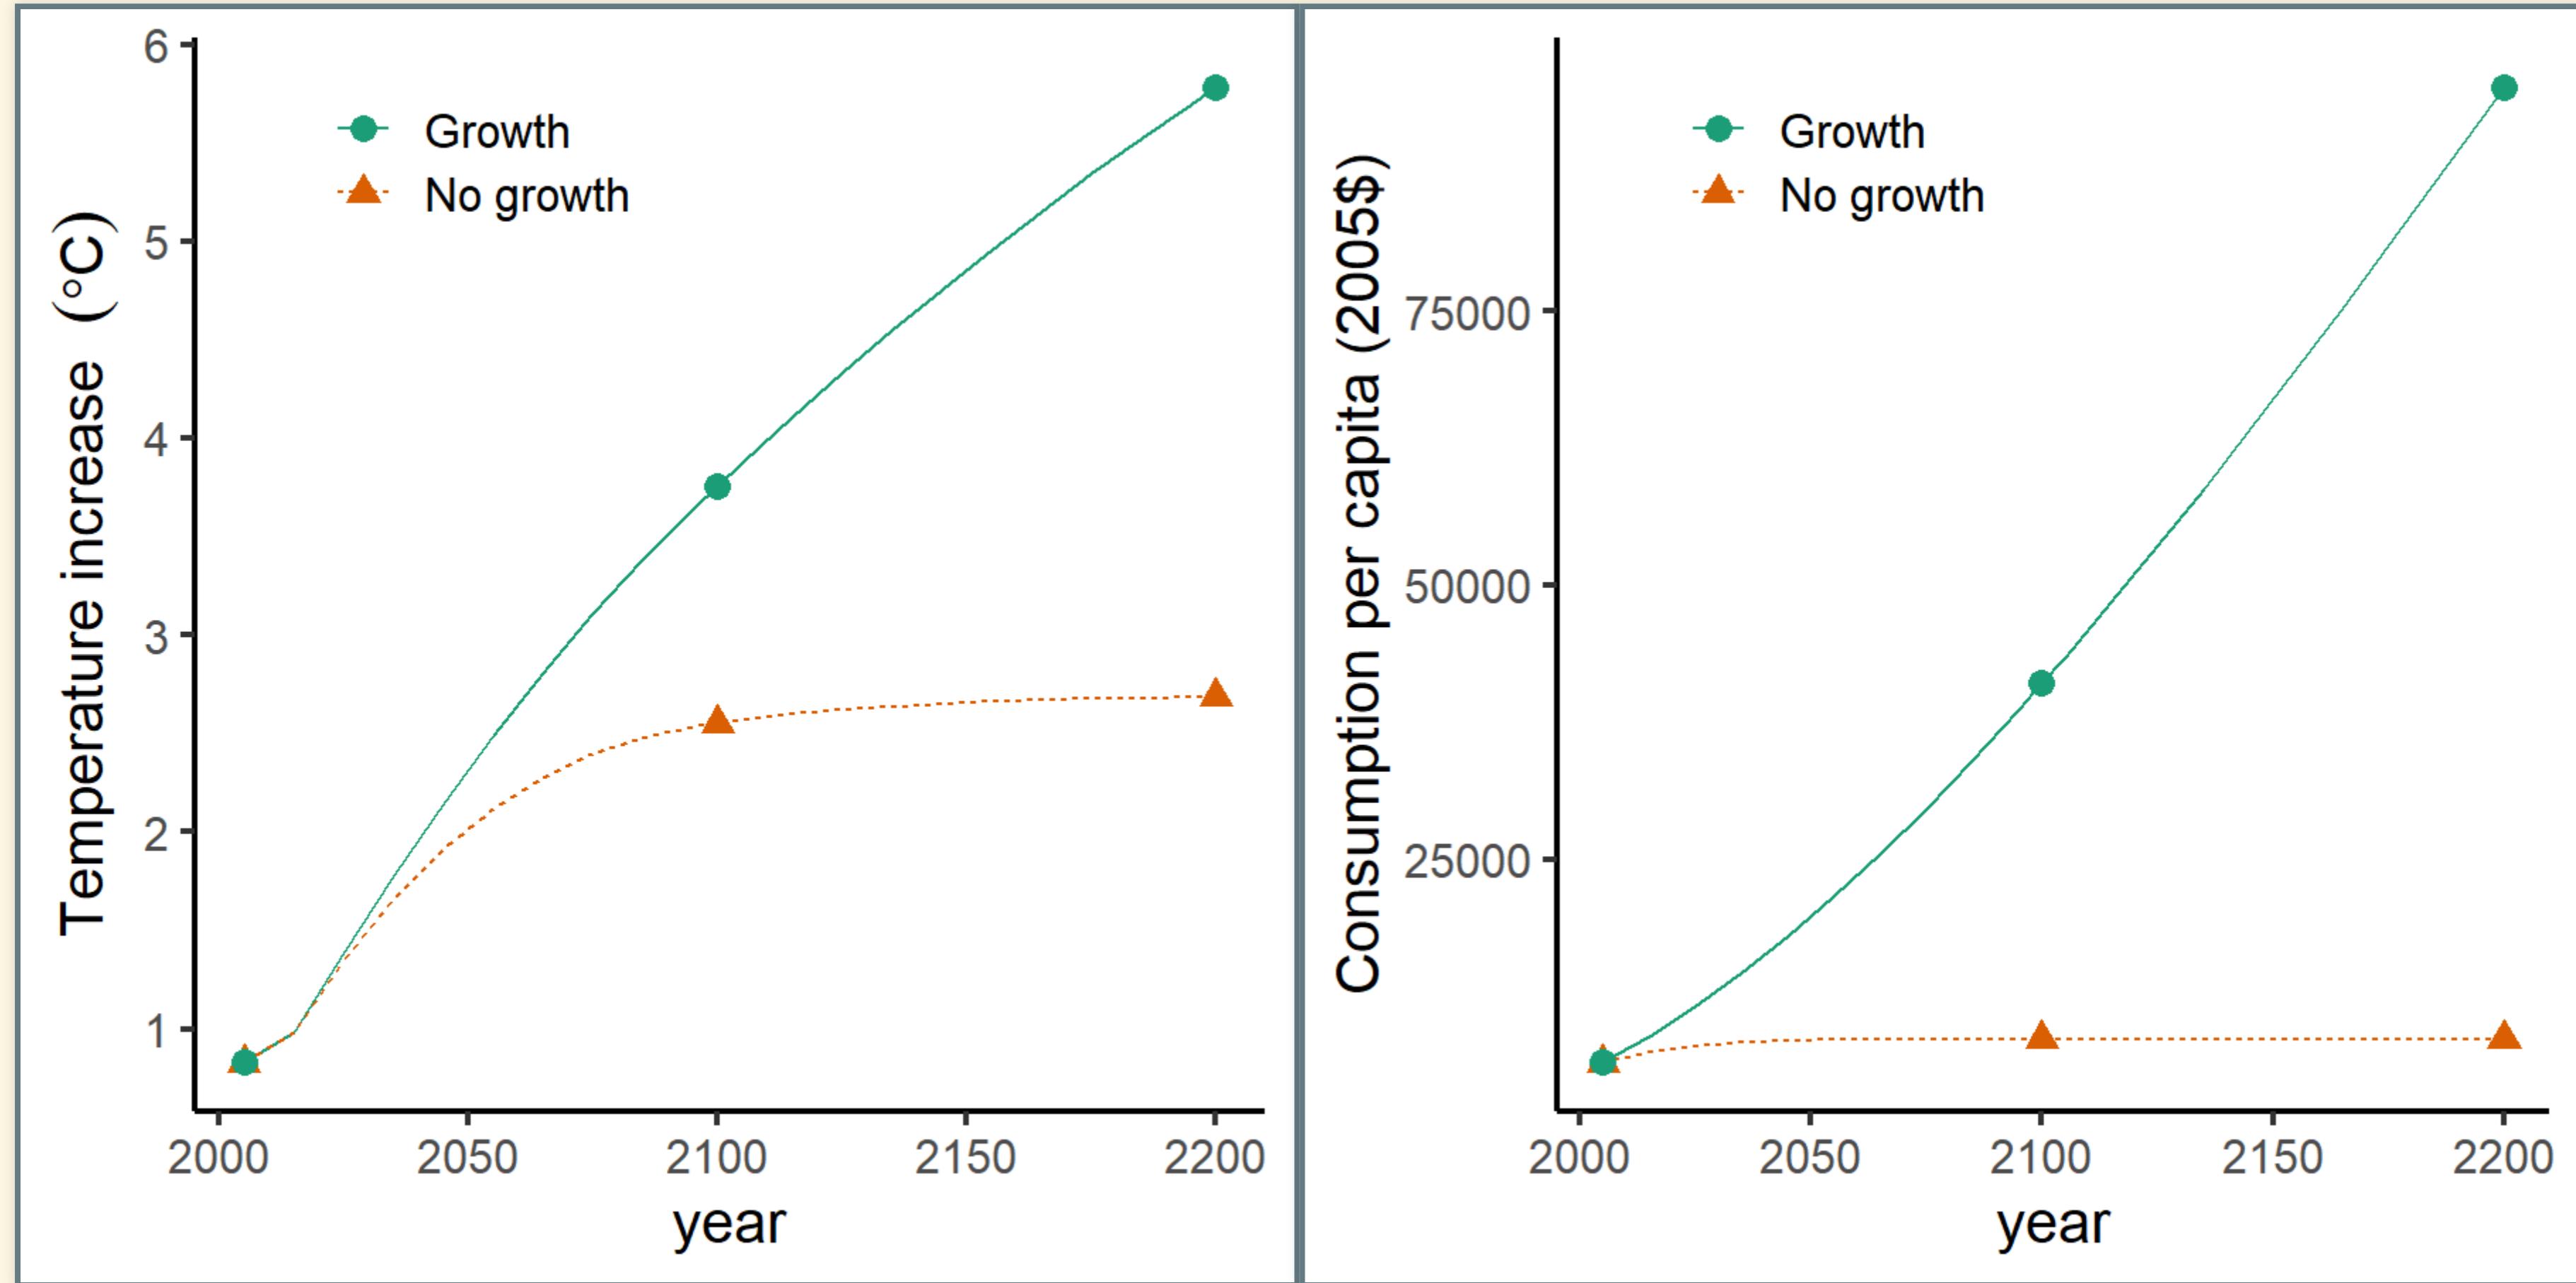

"The cost of delaying action for 50 years ... is [estimated] as \$6.5 trillion."

- Pielke:

"Policy makers routinely make decisions ... with a similar (or even less well-developed) state of understanding."

Economic Growth

Economic Growth

Mitigating Factors

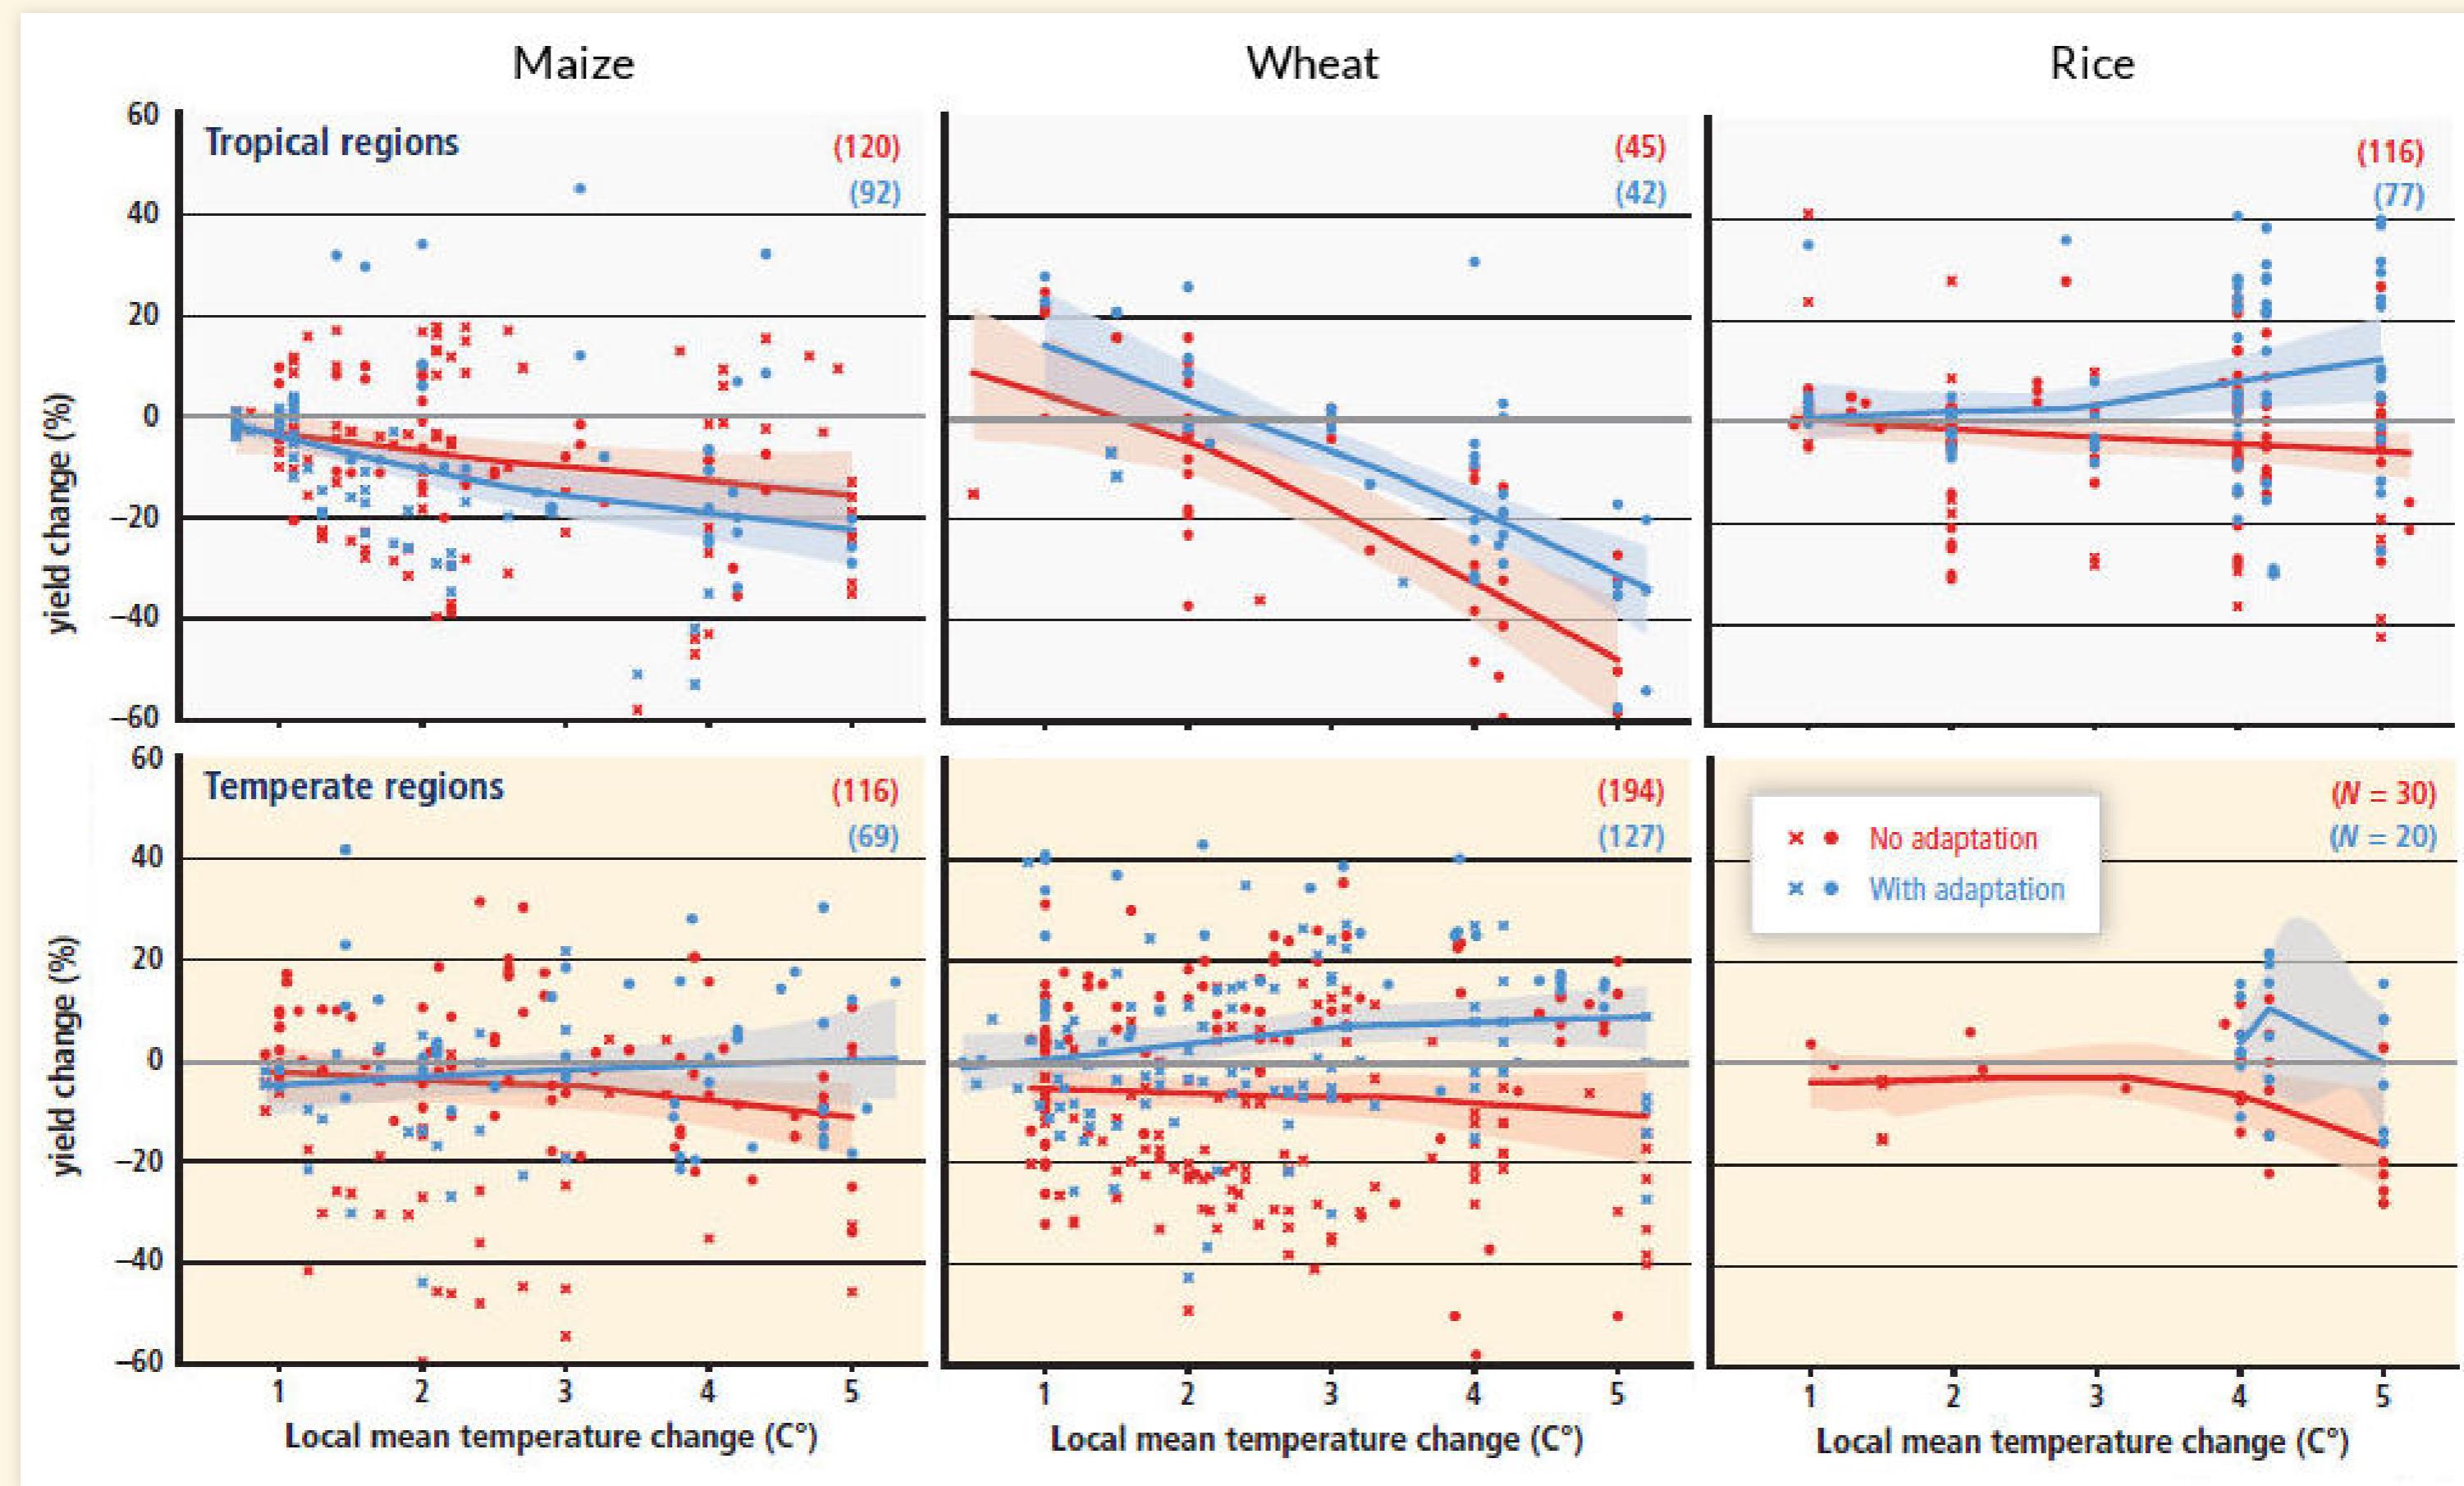

Mitigating Factors

- What are mitigating factors?
- Note:
 - Most policy analysis defines mitigation = reducing the **amount** of climate change (e.g. by cutting GHG emissions).
 - Nordhaus also uses the term to mean reducing the **impacts** of climate change
- Examples?
 - Carbon fertilization
 - Longer growing seasons at high latitudes
 - Higher temperature more snow falling on Antarctica
- Artificial Mitigation
 - Geoengineering

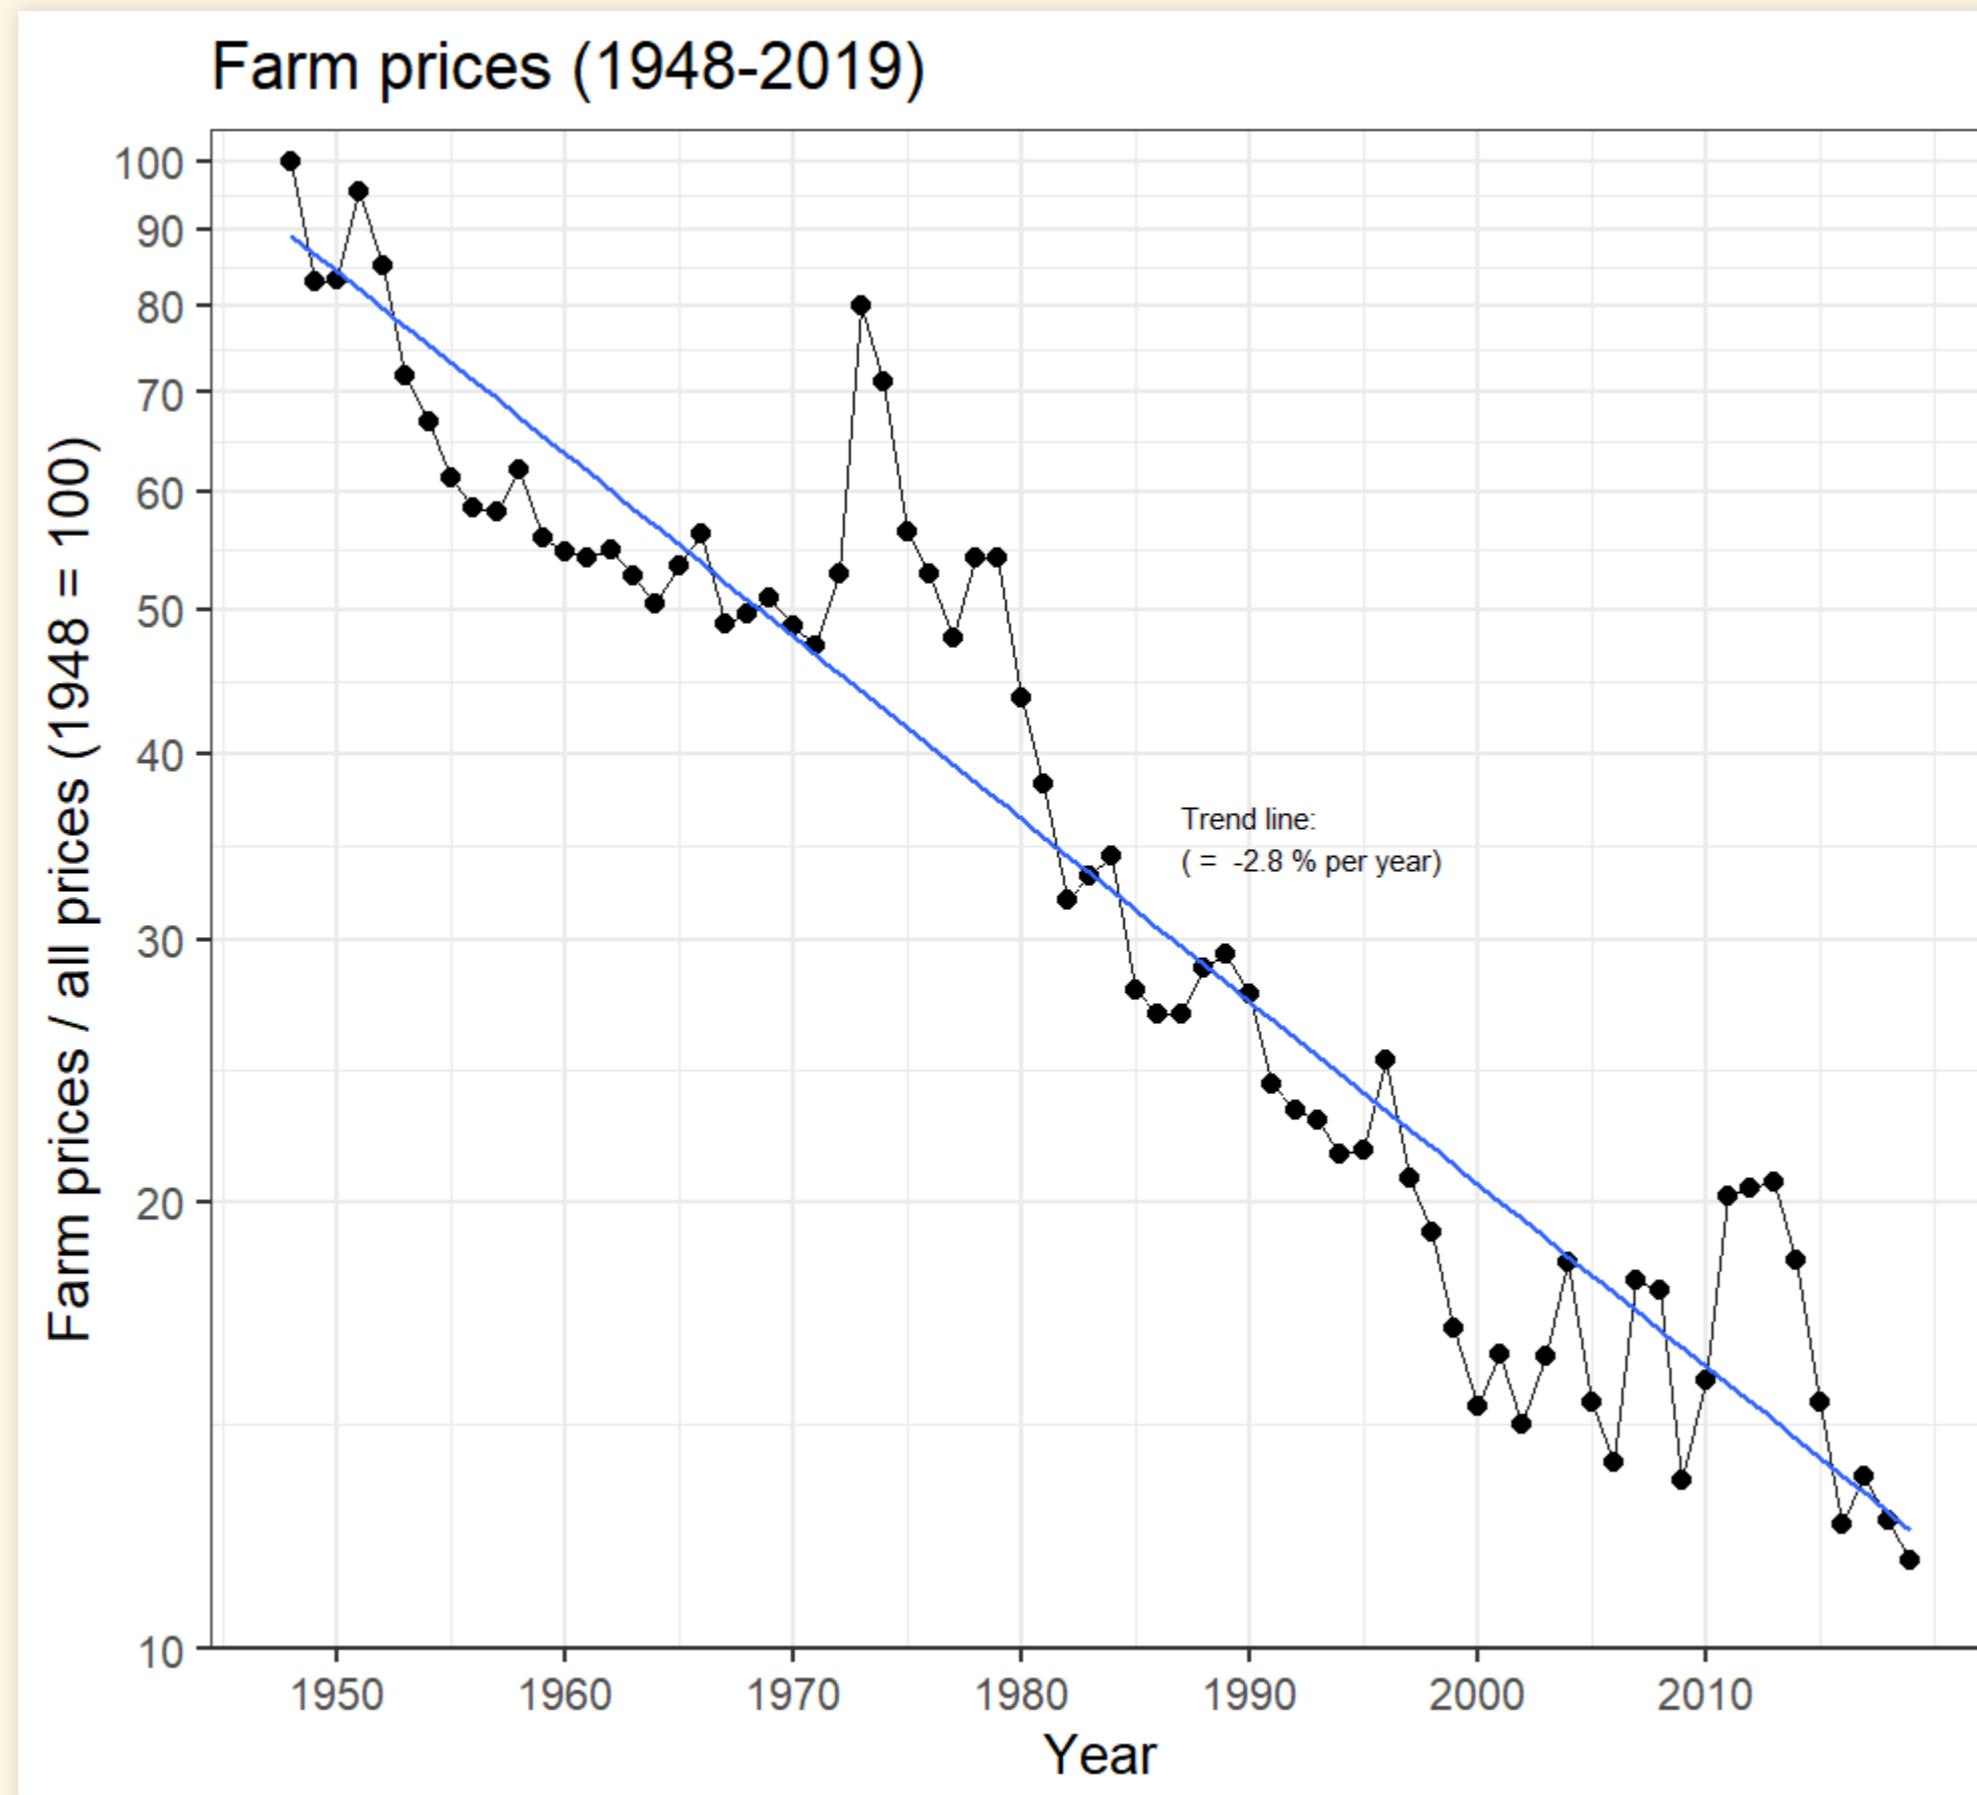

Adaptation

What kinds of things can people do
to adapt to climate change?

Crop Yields

Prices of Farm Products

Impact of Declining Food Prices

Category	% of income	Expense	25% price rise	as % of income
Income	100%	\$60,000		
Housing	20%	\$12,000	\$3,000	5%
Food	5%	\$3,000	\$750	1%

Agricultural Price Shocks

Winter Temperatures

- Cold winters are important
 - Freezing temperatures kill pests
 - Many trees need cold winters to tell them to reset for growing in the spring
 - Peach trees need more than 800 hours below 40° F to make good fruit
 - The winter of 2016–2017 had less than 500 “cold-soaking” hours in Georgia
 - 85% of the Georgia peach crop was lost.

Health Impacts

Deaths due to Climate Change

Years of life lost per 1,000 persons

Region	Total	Diarrheal disease	Malaria	Malnutrition
Africa	14.91	6.99	7.13	0.80
Wealthy countries	0.02	0.02	0.00	0.00

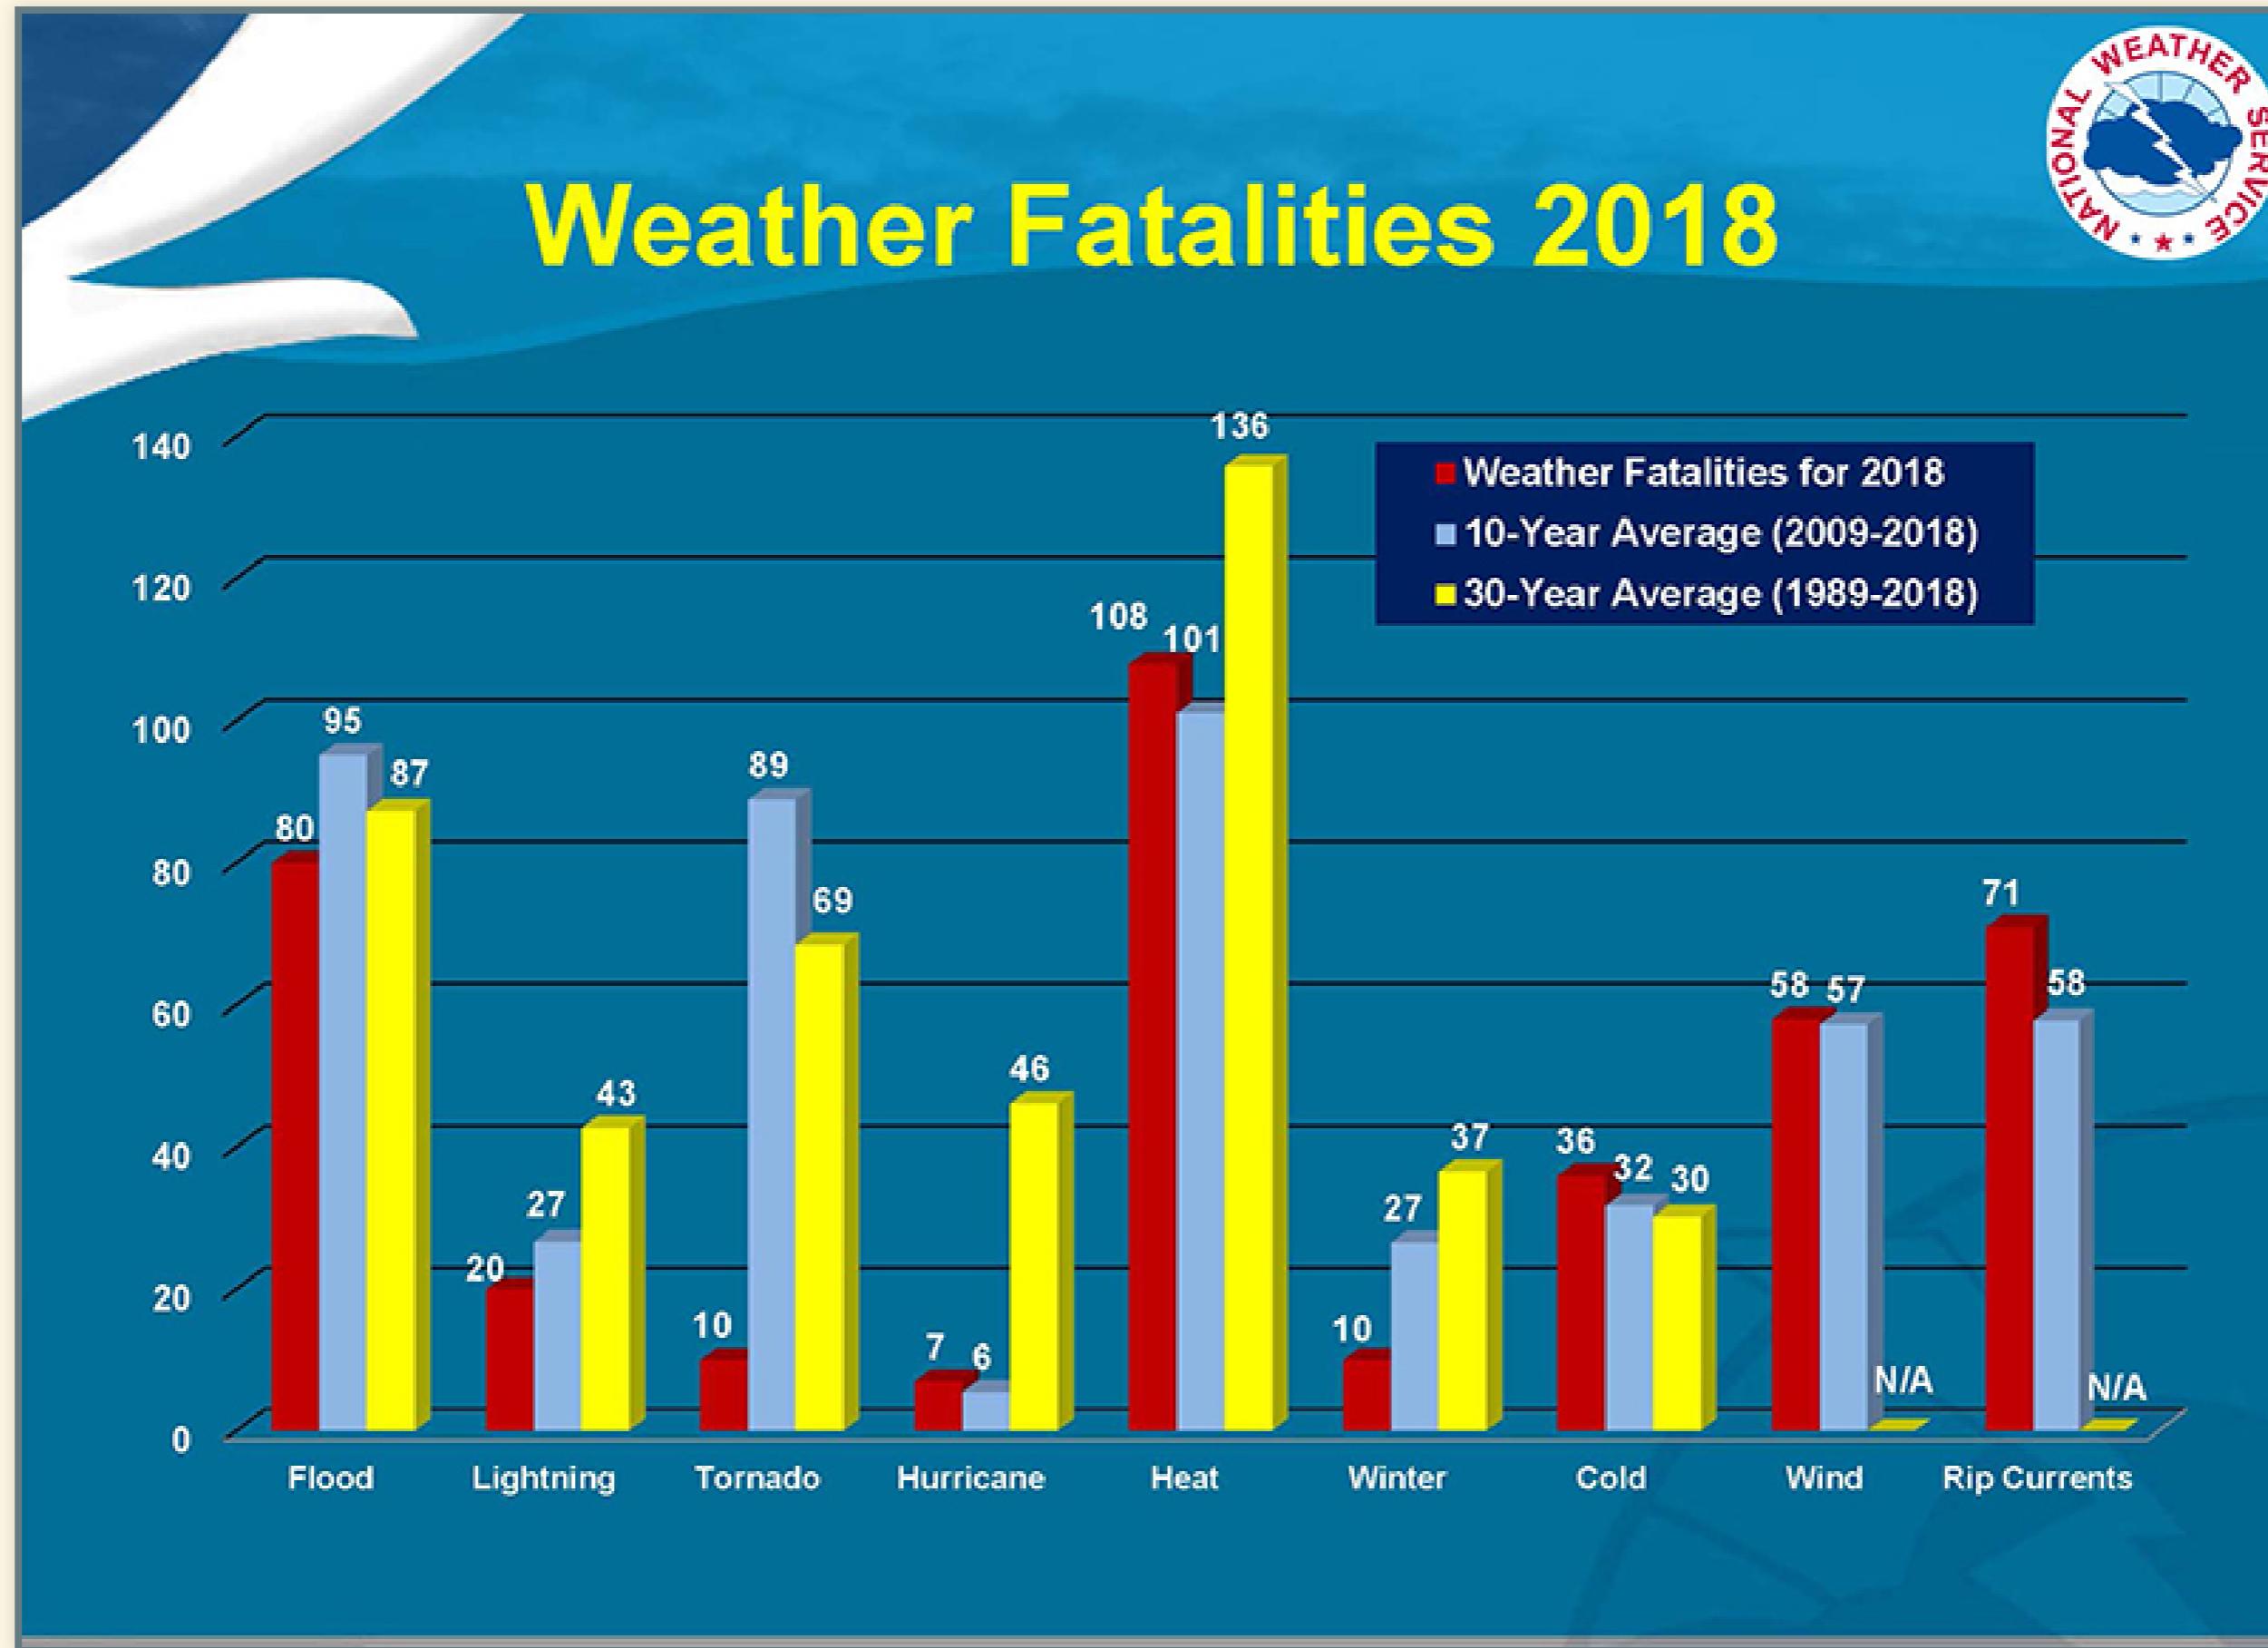

As % of all deaths

Region	Total	Diarrheal disease	Malaria	Malnutrition
Africa	2.92	1.37	1.40	0.16
Wealthy countries	0.01	0.01	0.00	0.00

Heat Waves

- Extreme summer heat that was **practically non-existent** before 1989 now affects about **10% of the earth's land surface** in a typical summer.
- Two of the ten deadliest heat waves in history happened in 2015.
- Six of the ten deadliest heat waves happened since 2000
 - Western Europe 2003: 70,000 deaths
 - Russia 2010: 56,000 deaths
 - **These could be typical summer heat by 2100.**

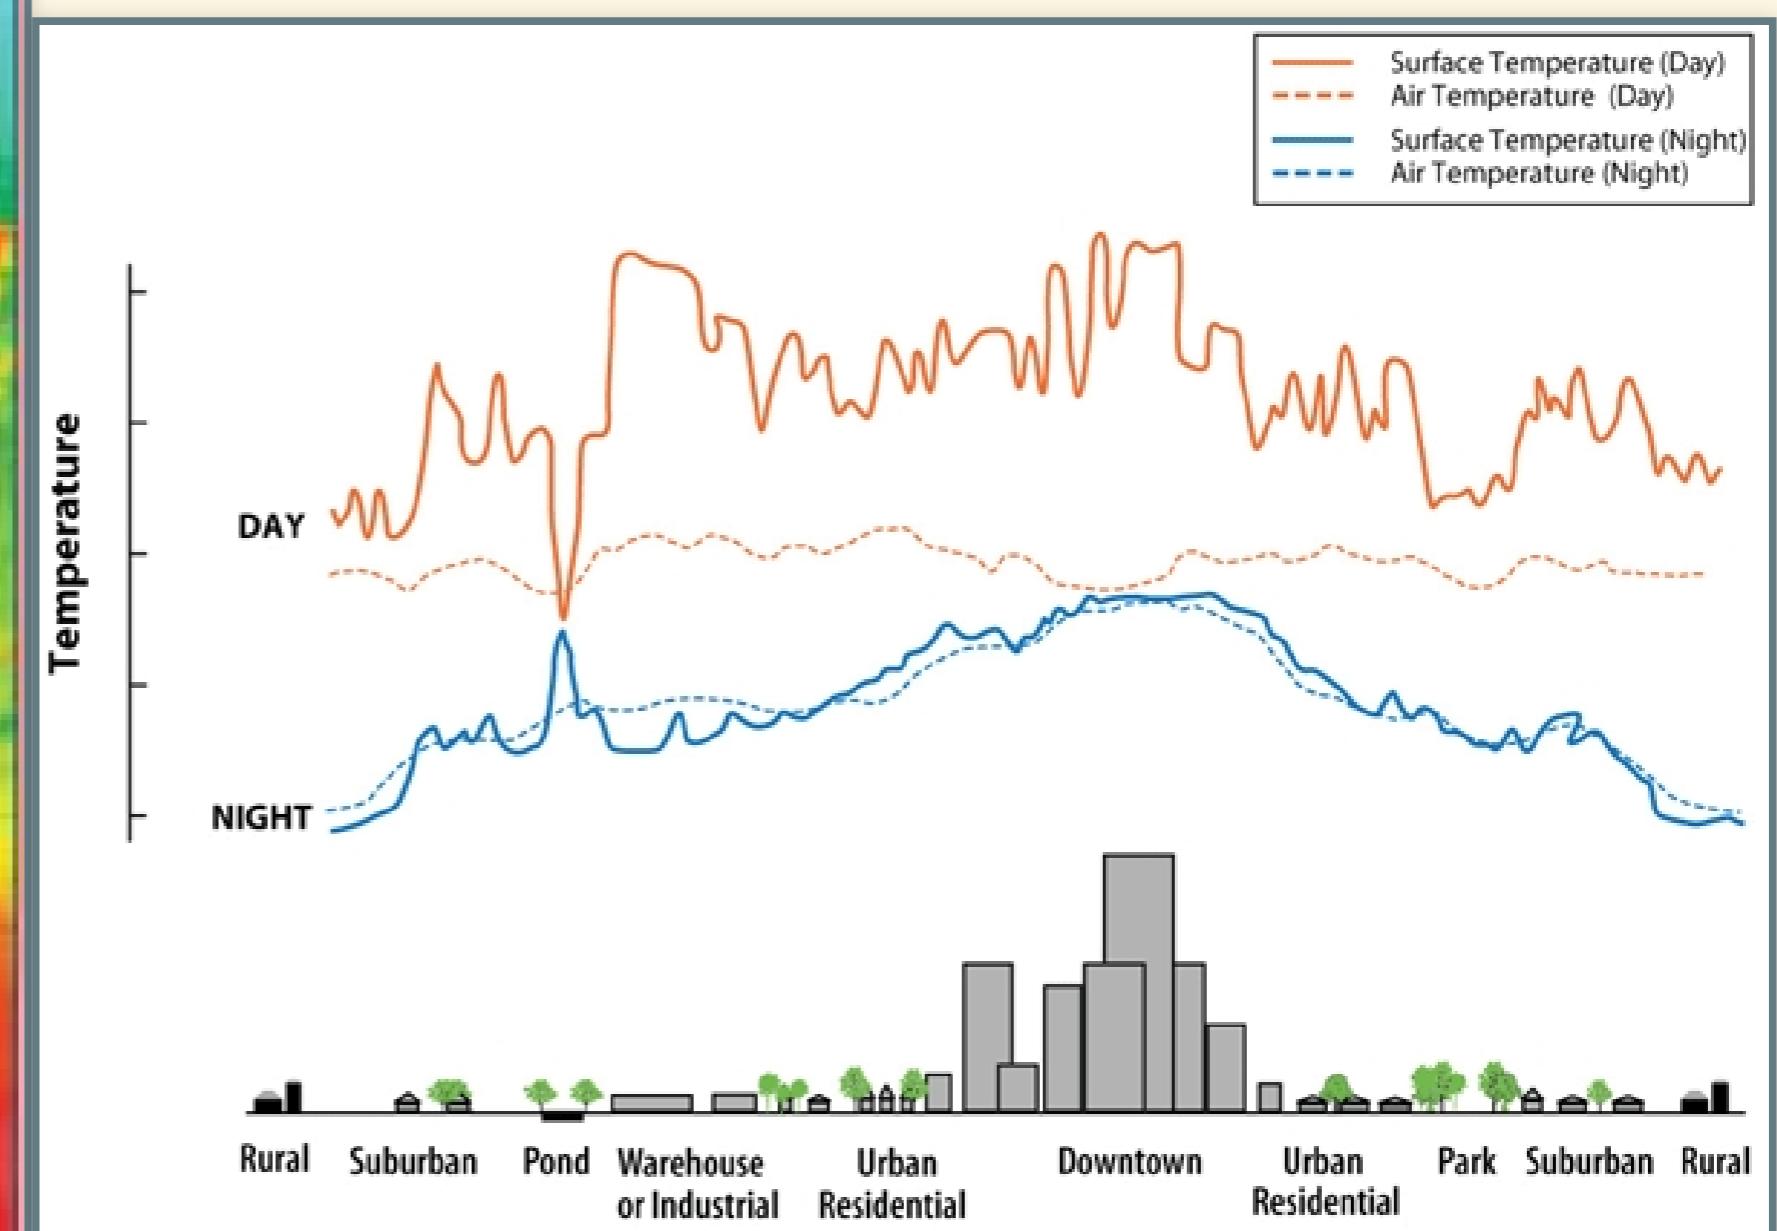

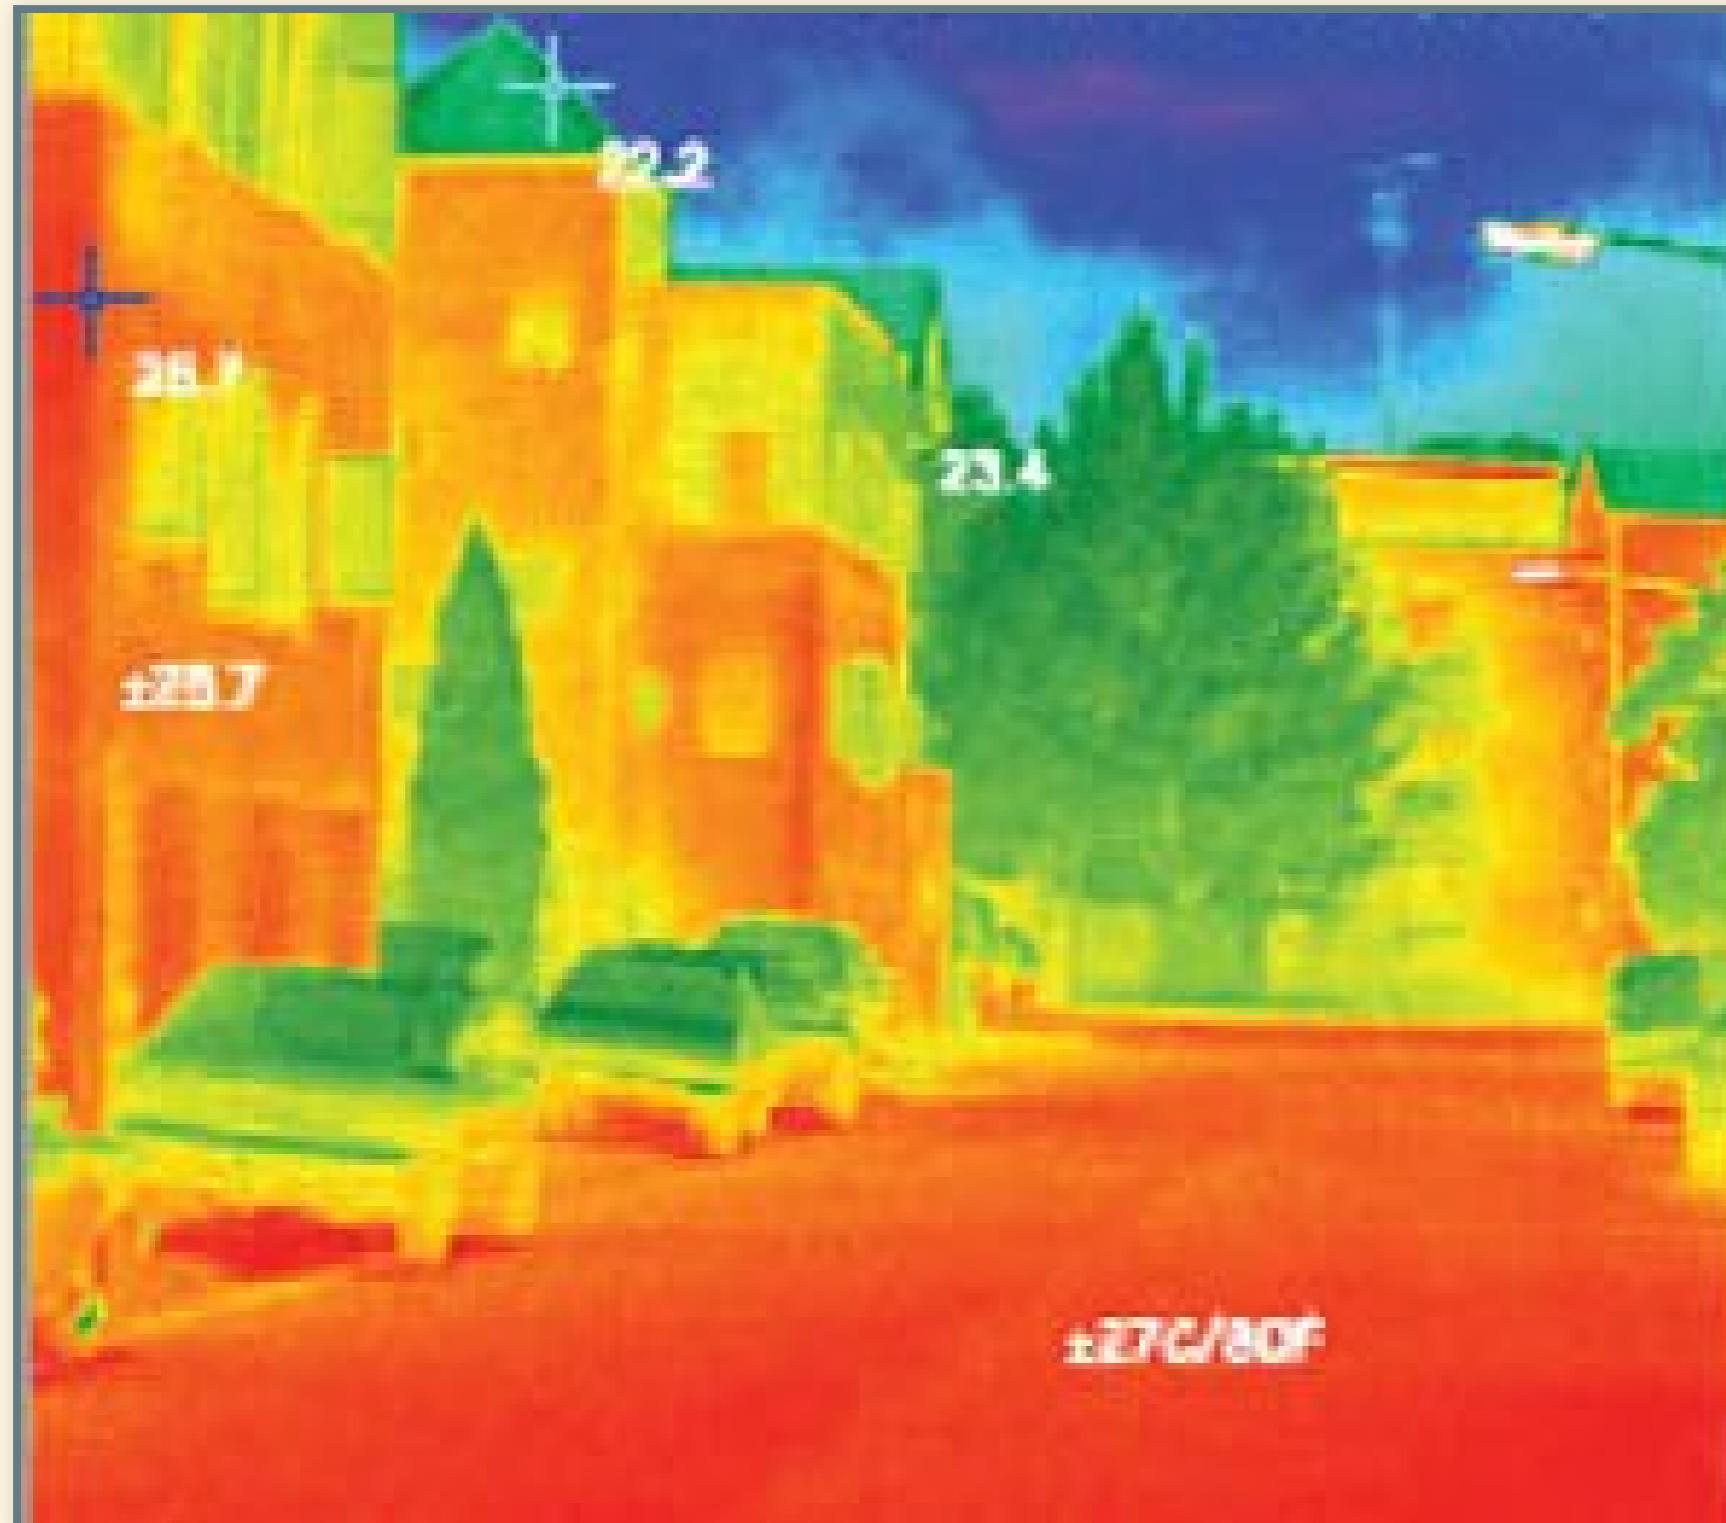

Heat versus Cold

Heat versus Cold

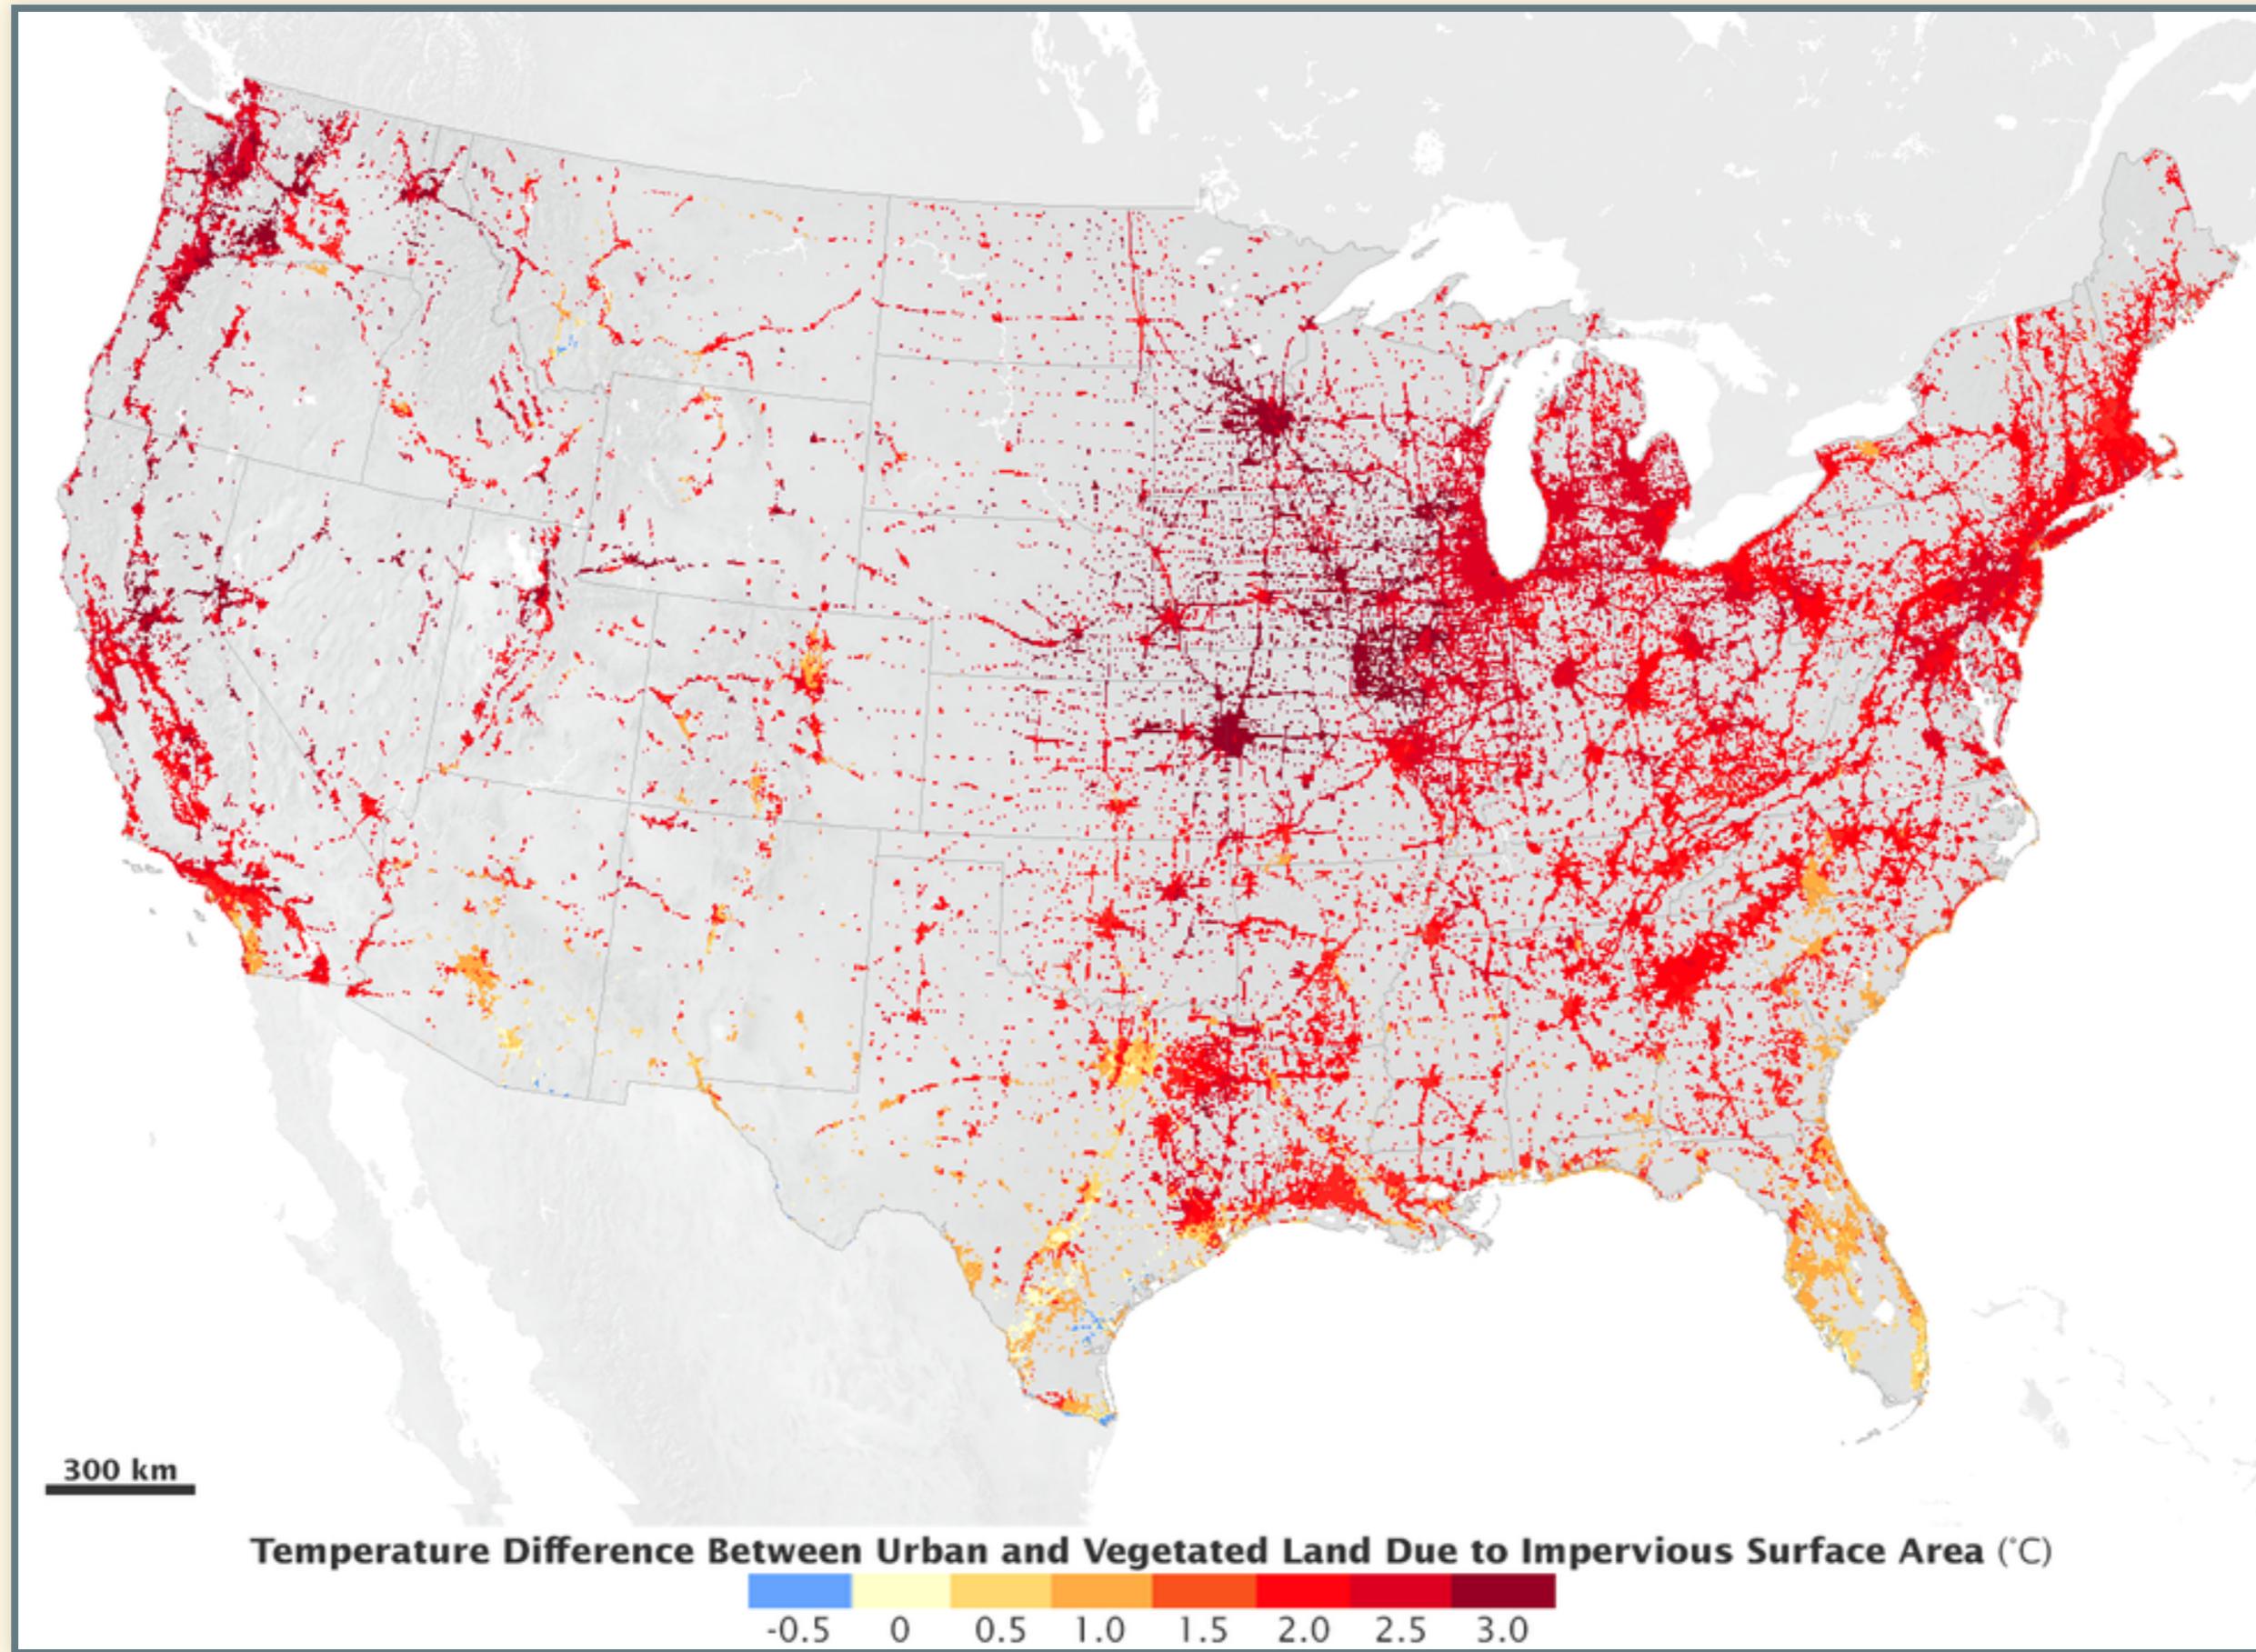

- More people die during cold months than hot months each year
 - Confounding factor: Seasonality of diseases (flu, etc.)
 - Deaths from cold are relative: it's about acclimation
 - Deaths from heat are absolute: threshold temperatures
- Adding extremely hot days raises mortality much more than adding extremely cold days

Urban Heat Islands

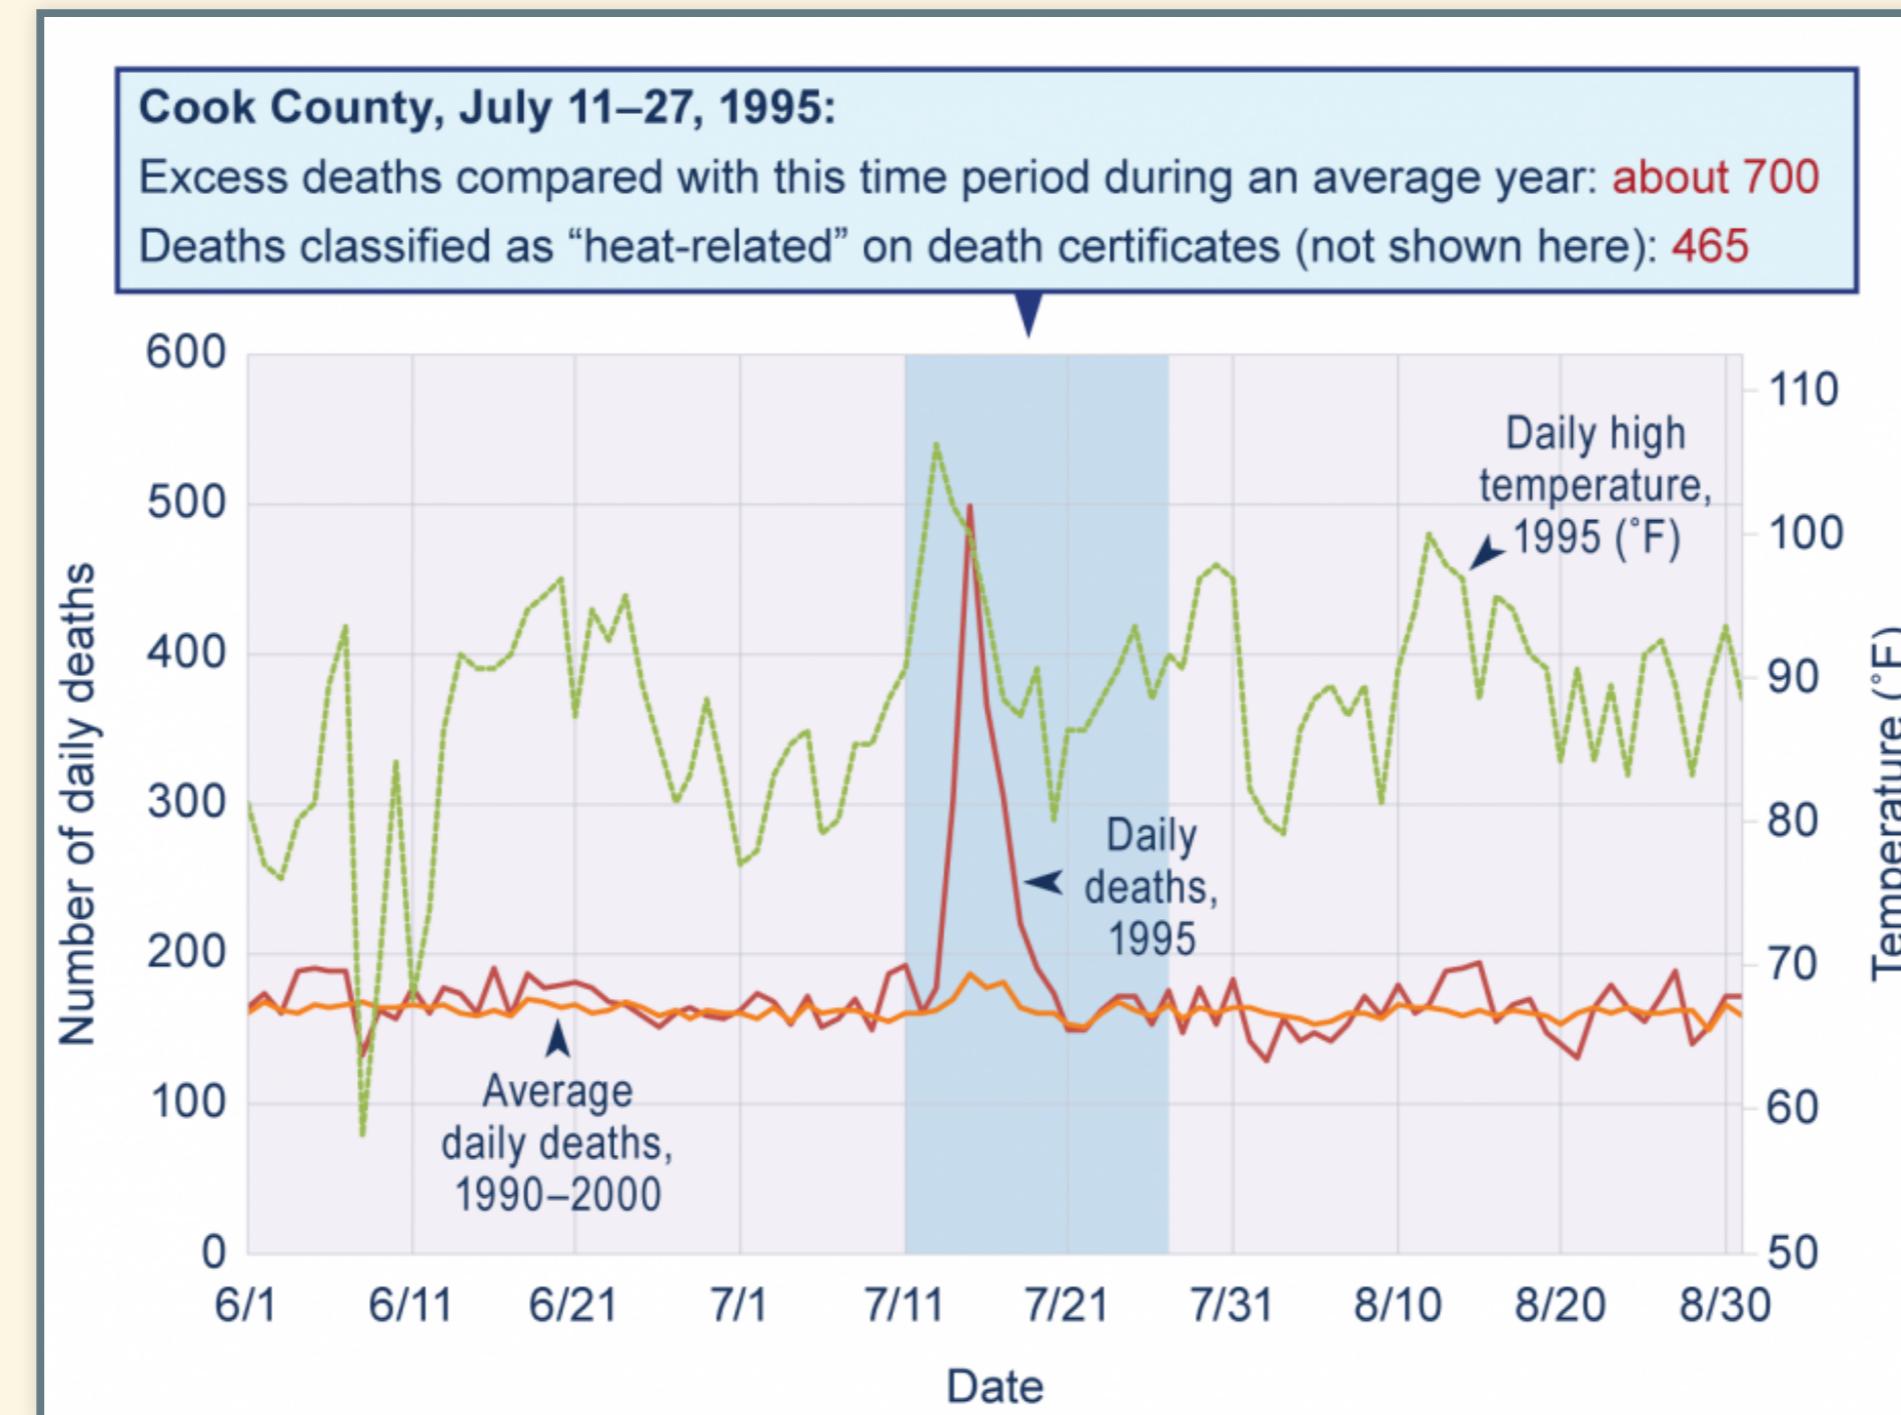

Source: Environmental Protection Agency

Urban Heat Islands in the United States

Urban Heat Mortality

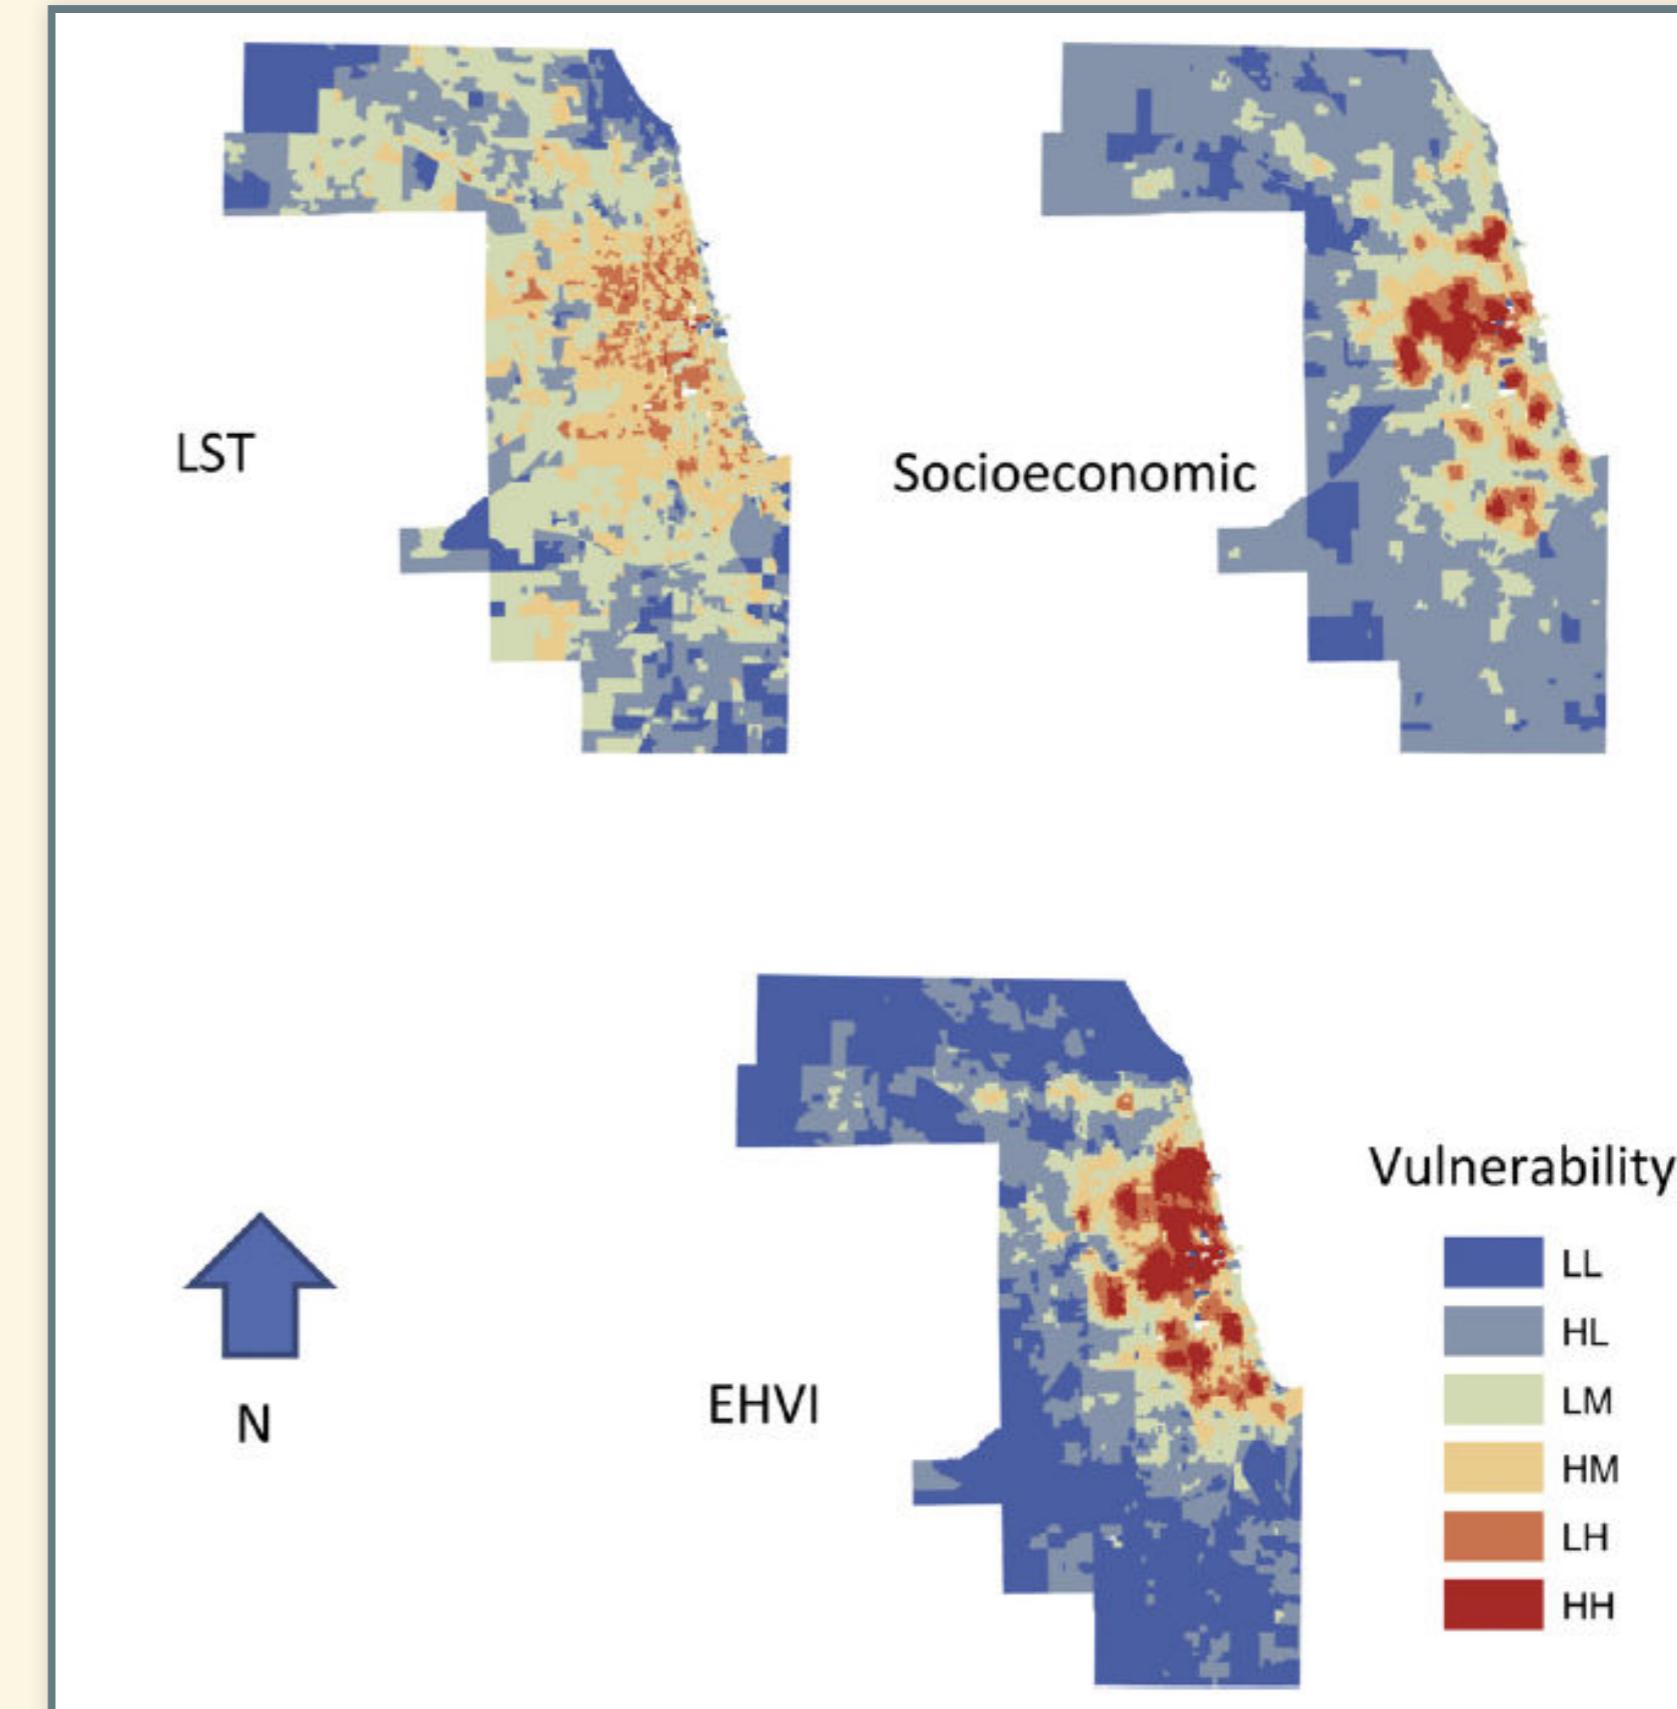

Chicago, 1995

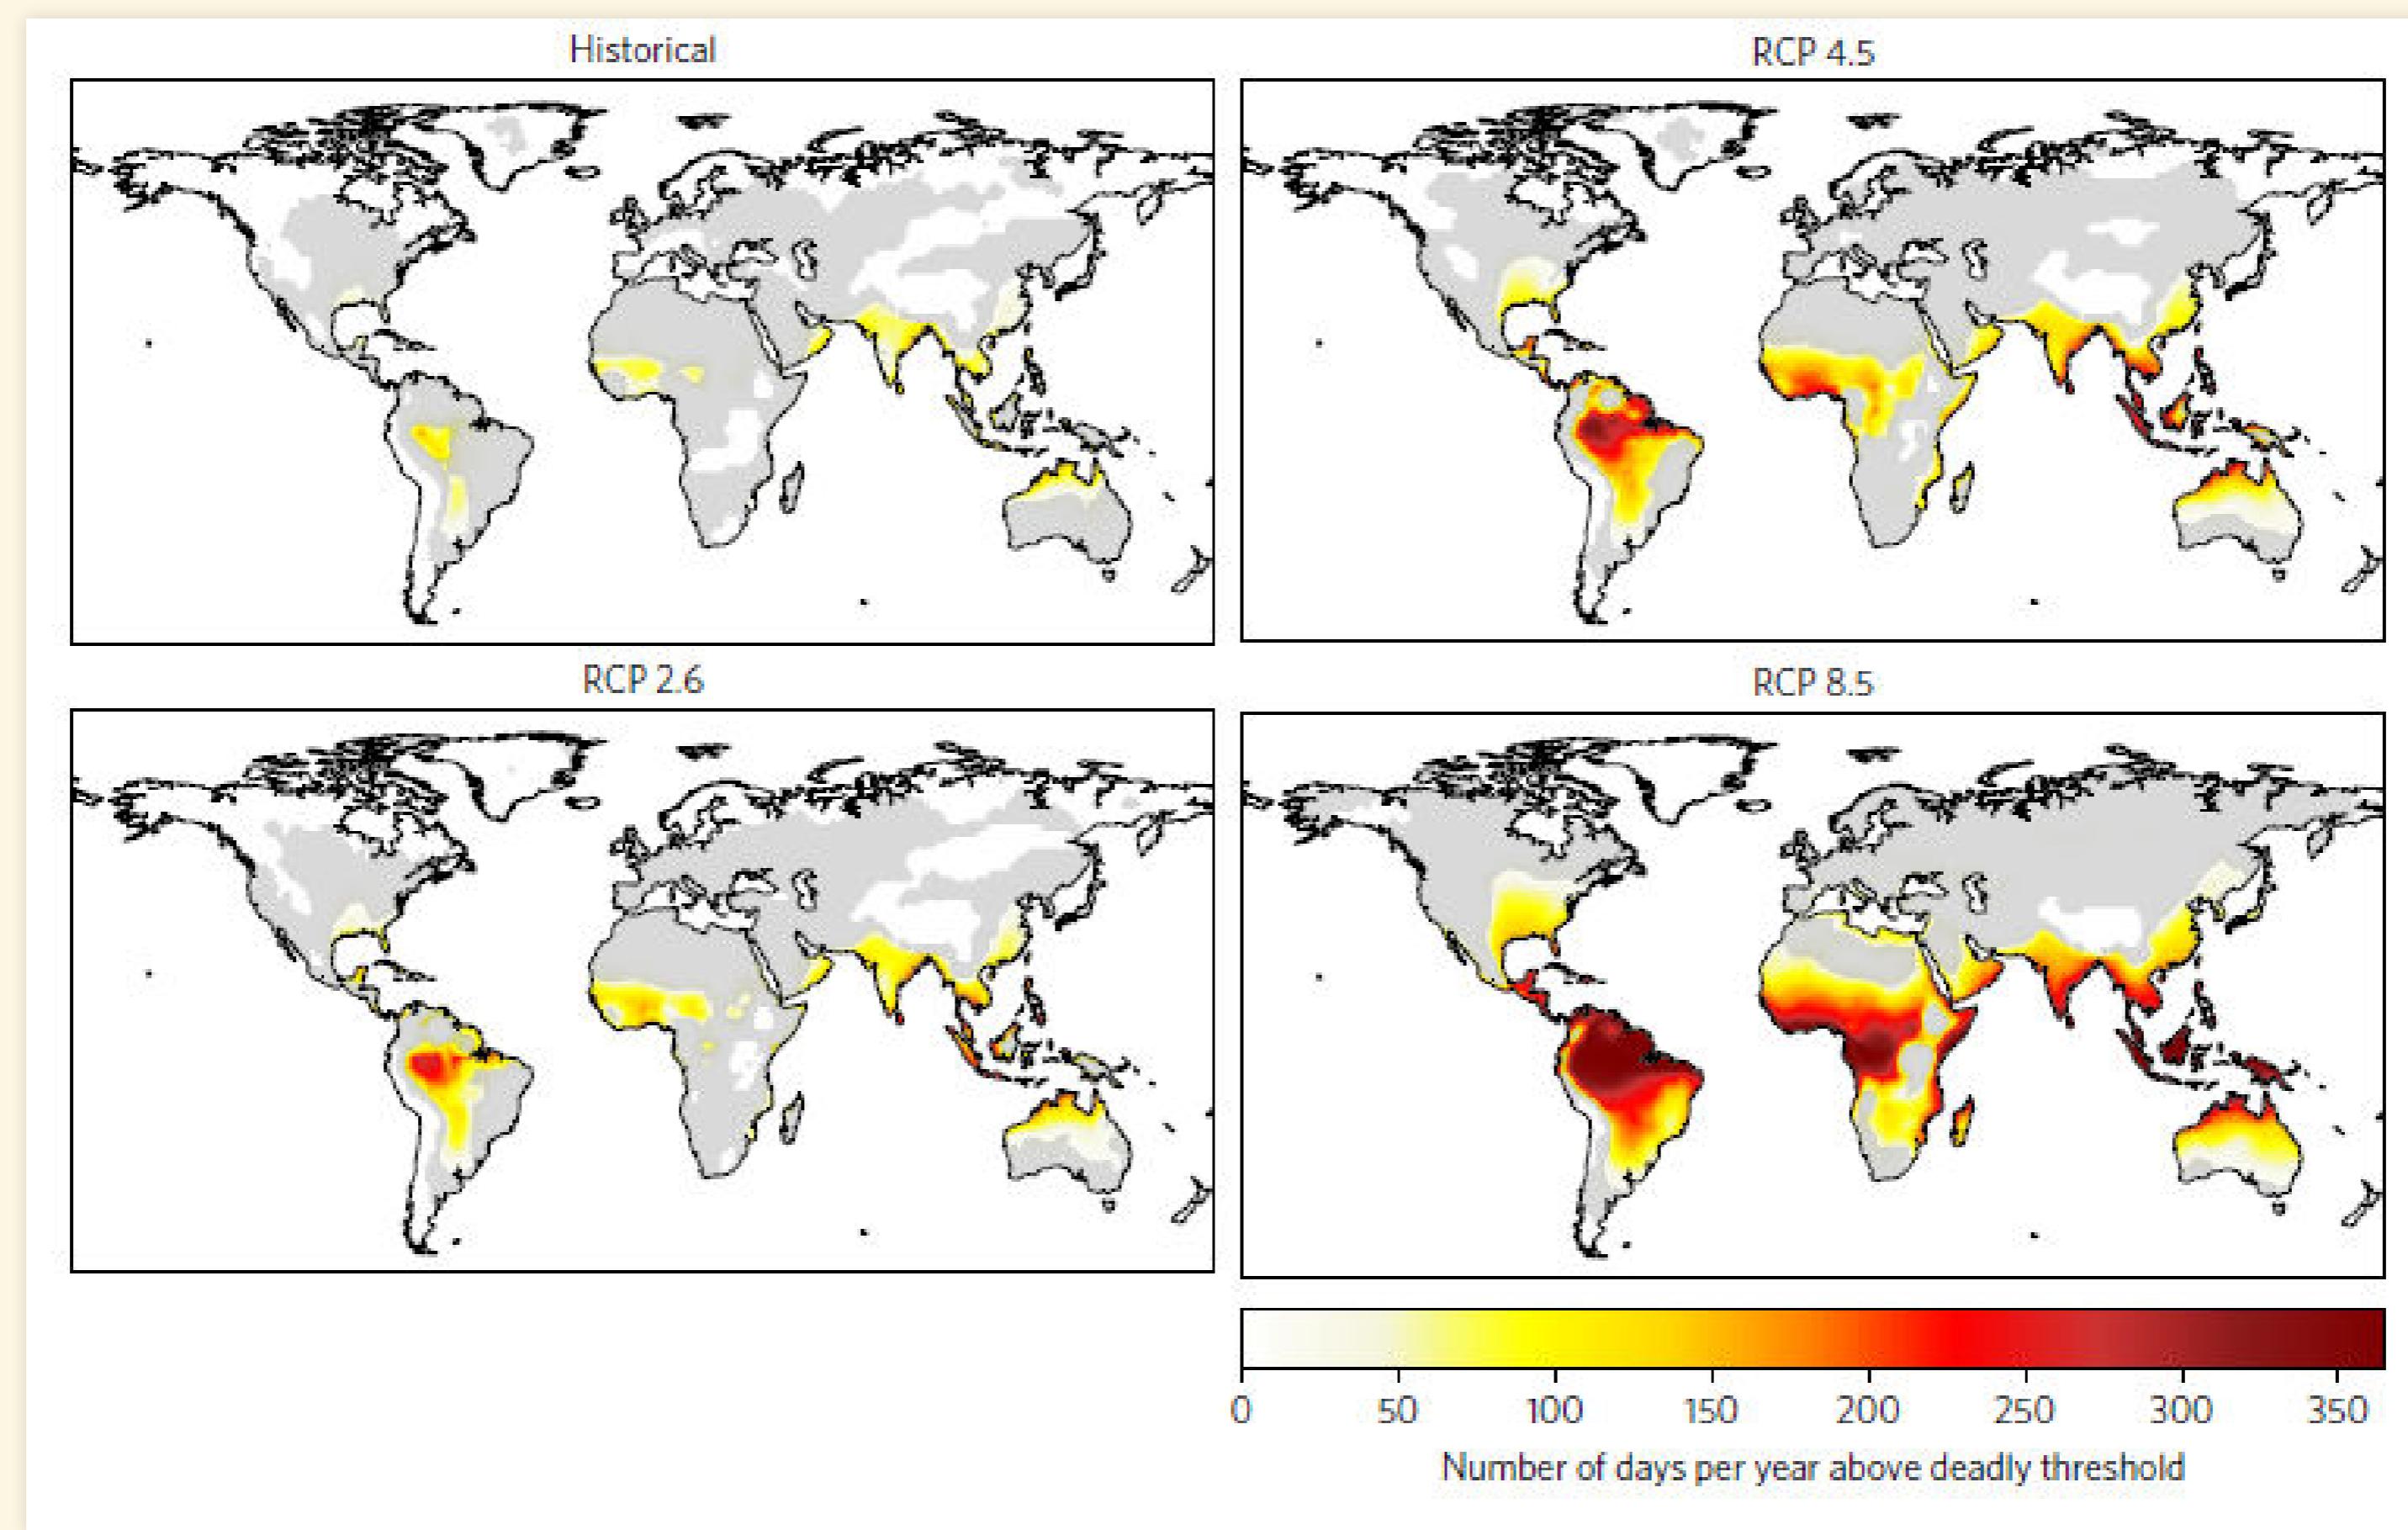

Source: USGCRP, *The Impacts of Climate Change on Human Health in the United States: A Scientific Assessment* (2016).

Socioeconomic Status and Vulnerability to Heat

- LST = Urban heat island effect
- EHVI = extreme heat vulnerability index
- EHVI correlates very strongly with socioeconomic variables

Climate Change and Deadly Heat

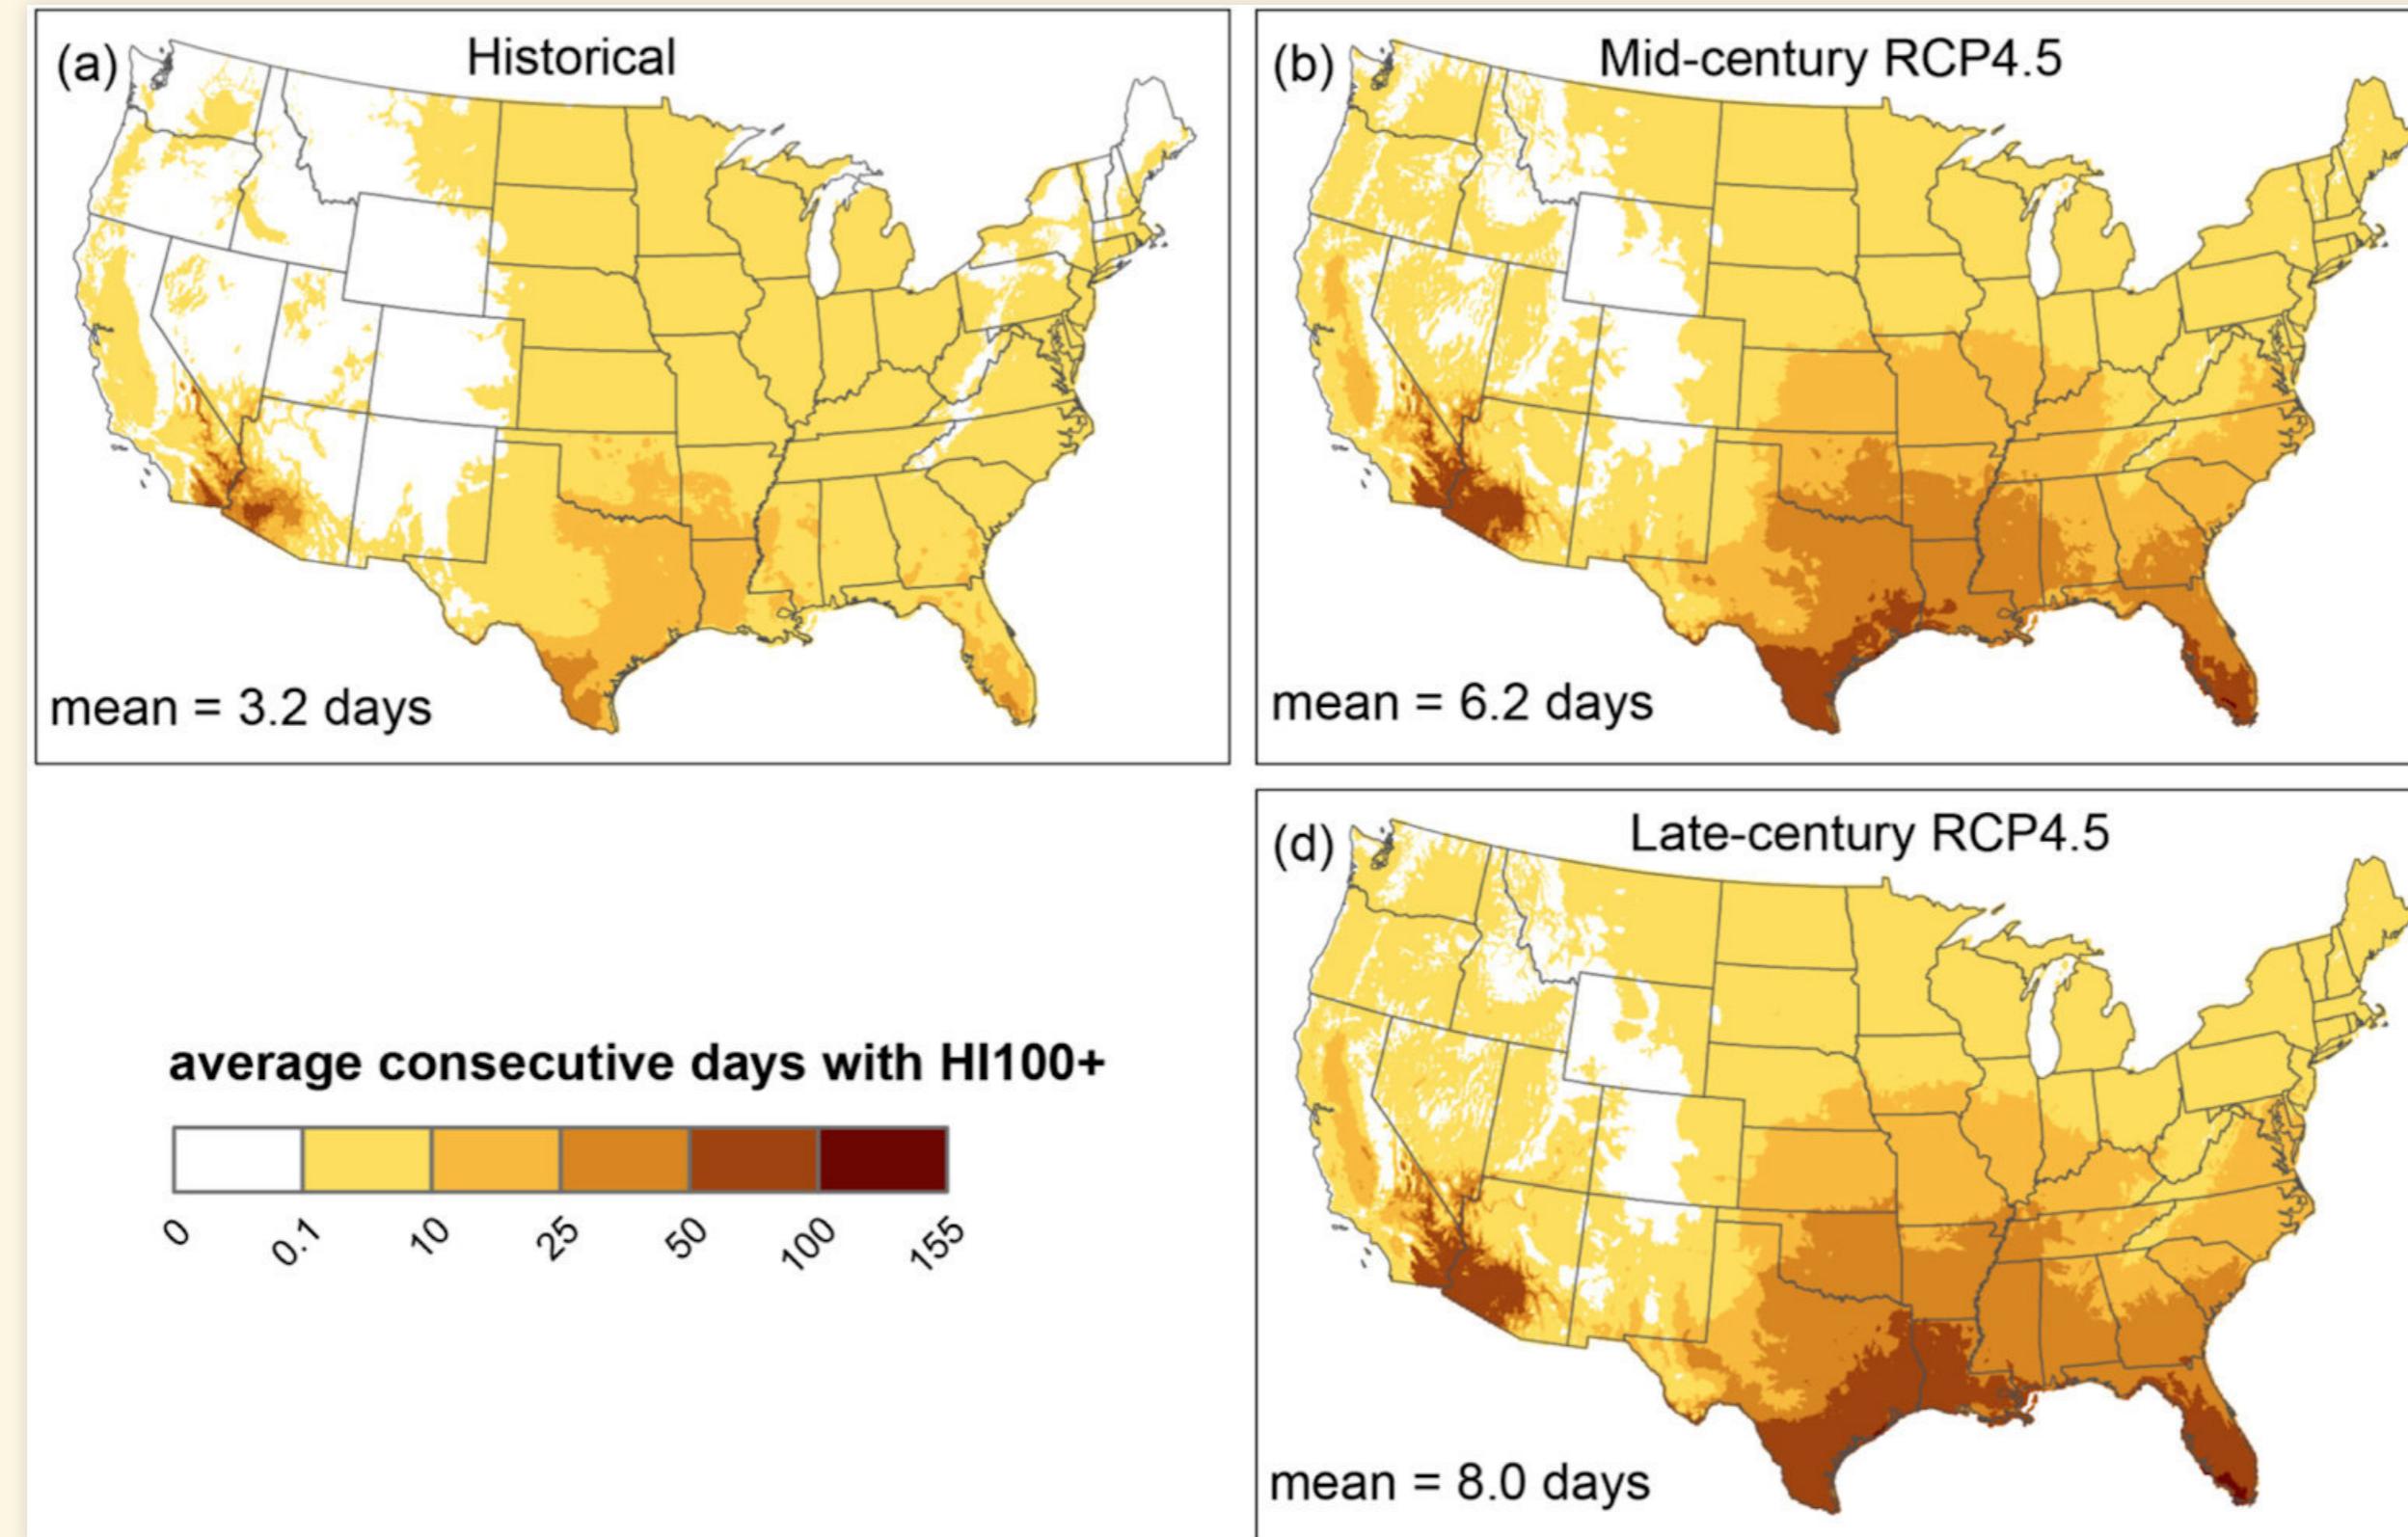

More than Deaths

- In the South, many people work outside
 - Construction, farming, logging, etc.
 - Summer heat waves could make it dangerous to be physically active outdoors
 - Loss of working hours, lower economic productivity, less money

Severe Heat Waves

- Severe heat waves even with serious emission reductions.

Football Practice in Heat

Football practice health/safety rules:

- Heat index of 104 or more is considered **dangerous**
 - Constant observation and supervision for overheating
 - No pads or equipment
 - 5 minutes mandatory rest and water break every 15 minutes
- After 2070:
 - Average of 3 weeks per year in Southeast & Midwest
 - 2 months per year in Texas, Louisiana, Southern Florida

Sea-Level Rise

Sea-Level Rise

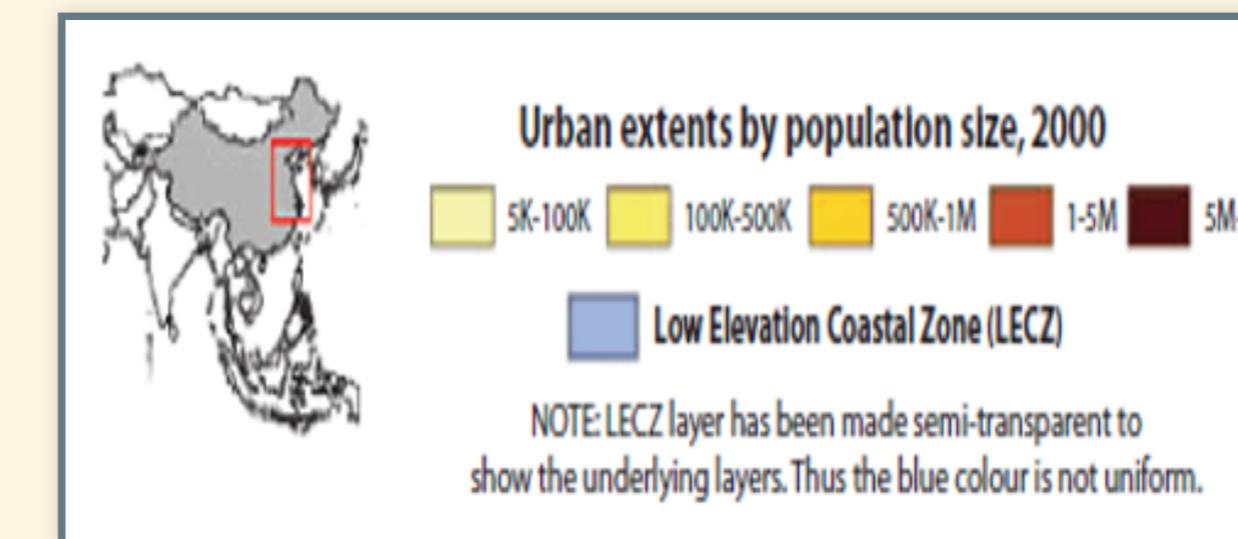

- Sea level rise is causing increasing flooding in coastal cities
 - “King tides” in Miami are flooding the city even in good weather.
 - When hurricanes come, storm surges are higher and more destructive

Low-Elevation Coastal Zone

- Within 10 meters of sea level
- 2/3 of cities with >5 million people
- 10% of world population

Greenland

- Melt descending into Moulin
 - Meltwater lubricates base of glacier
 - Accelerates ice-flow
 - Speeds up melting

Peterman Glacier 2009

Antarctica

Antarctica

GRACE Satellite

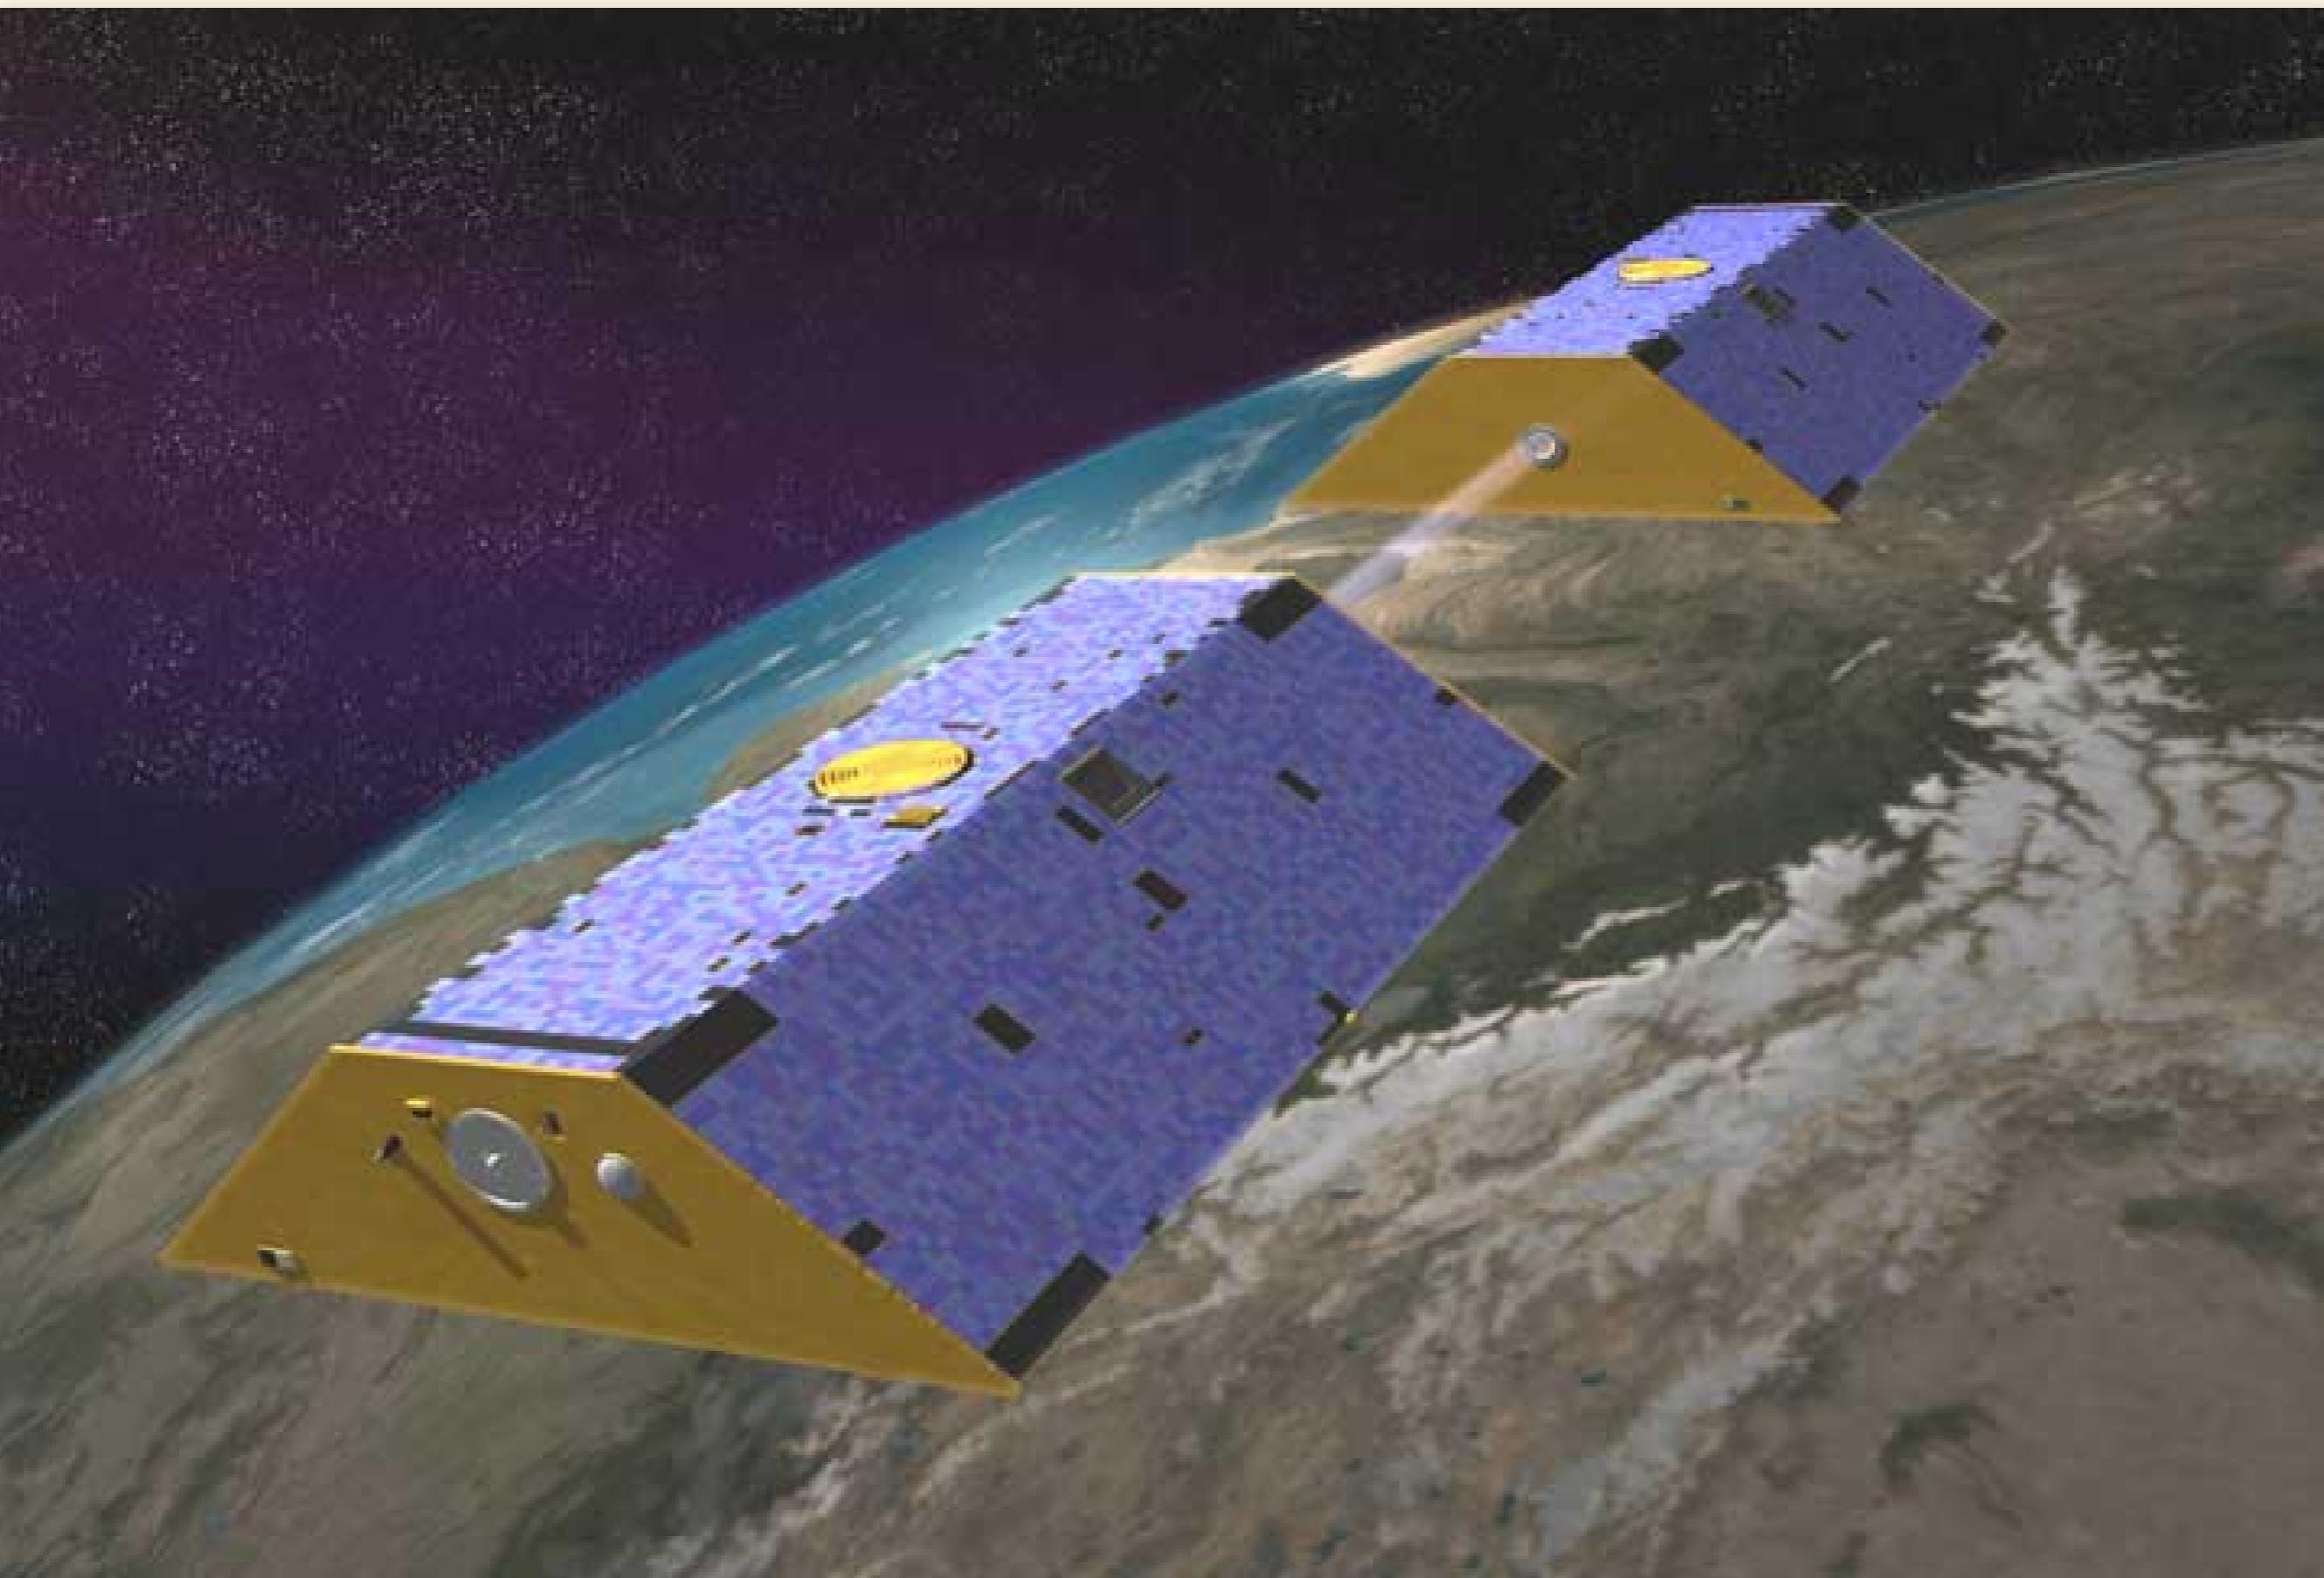

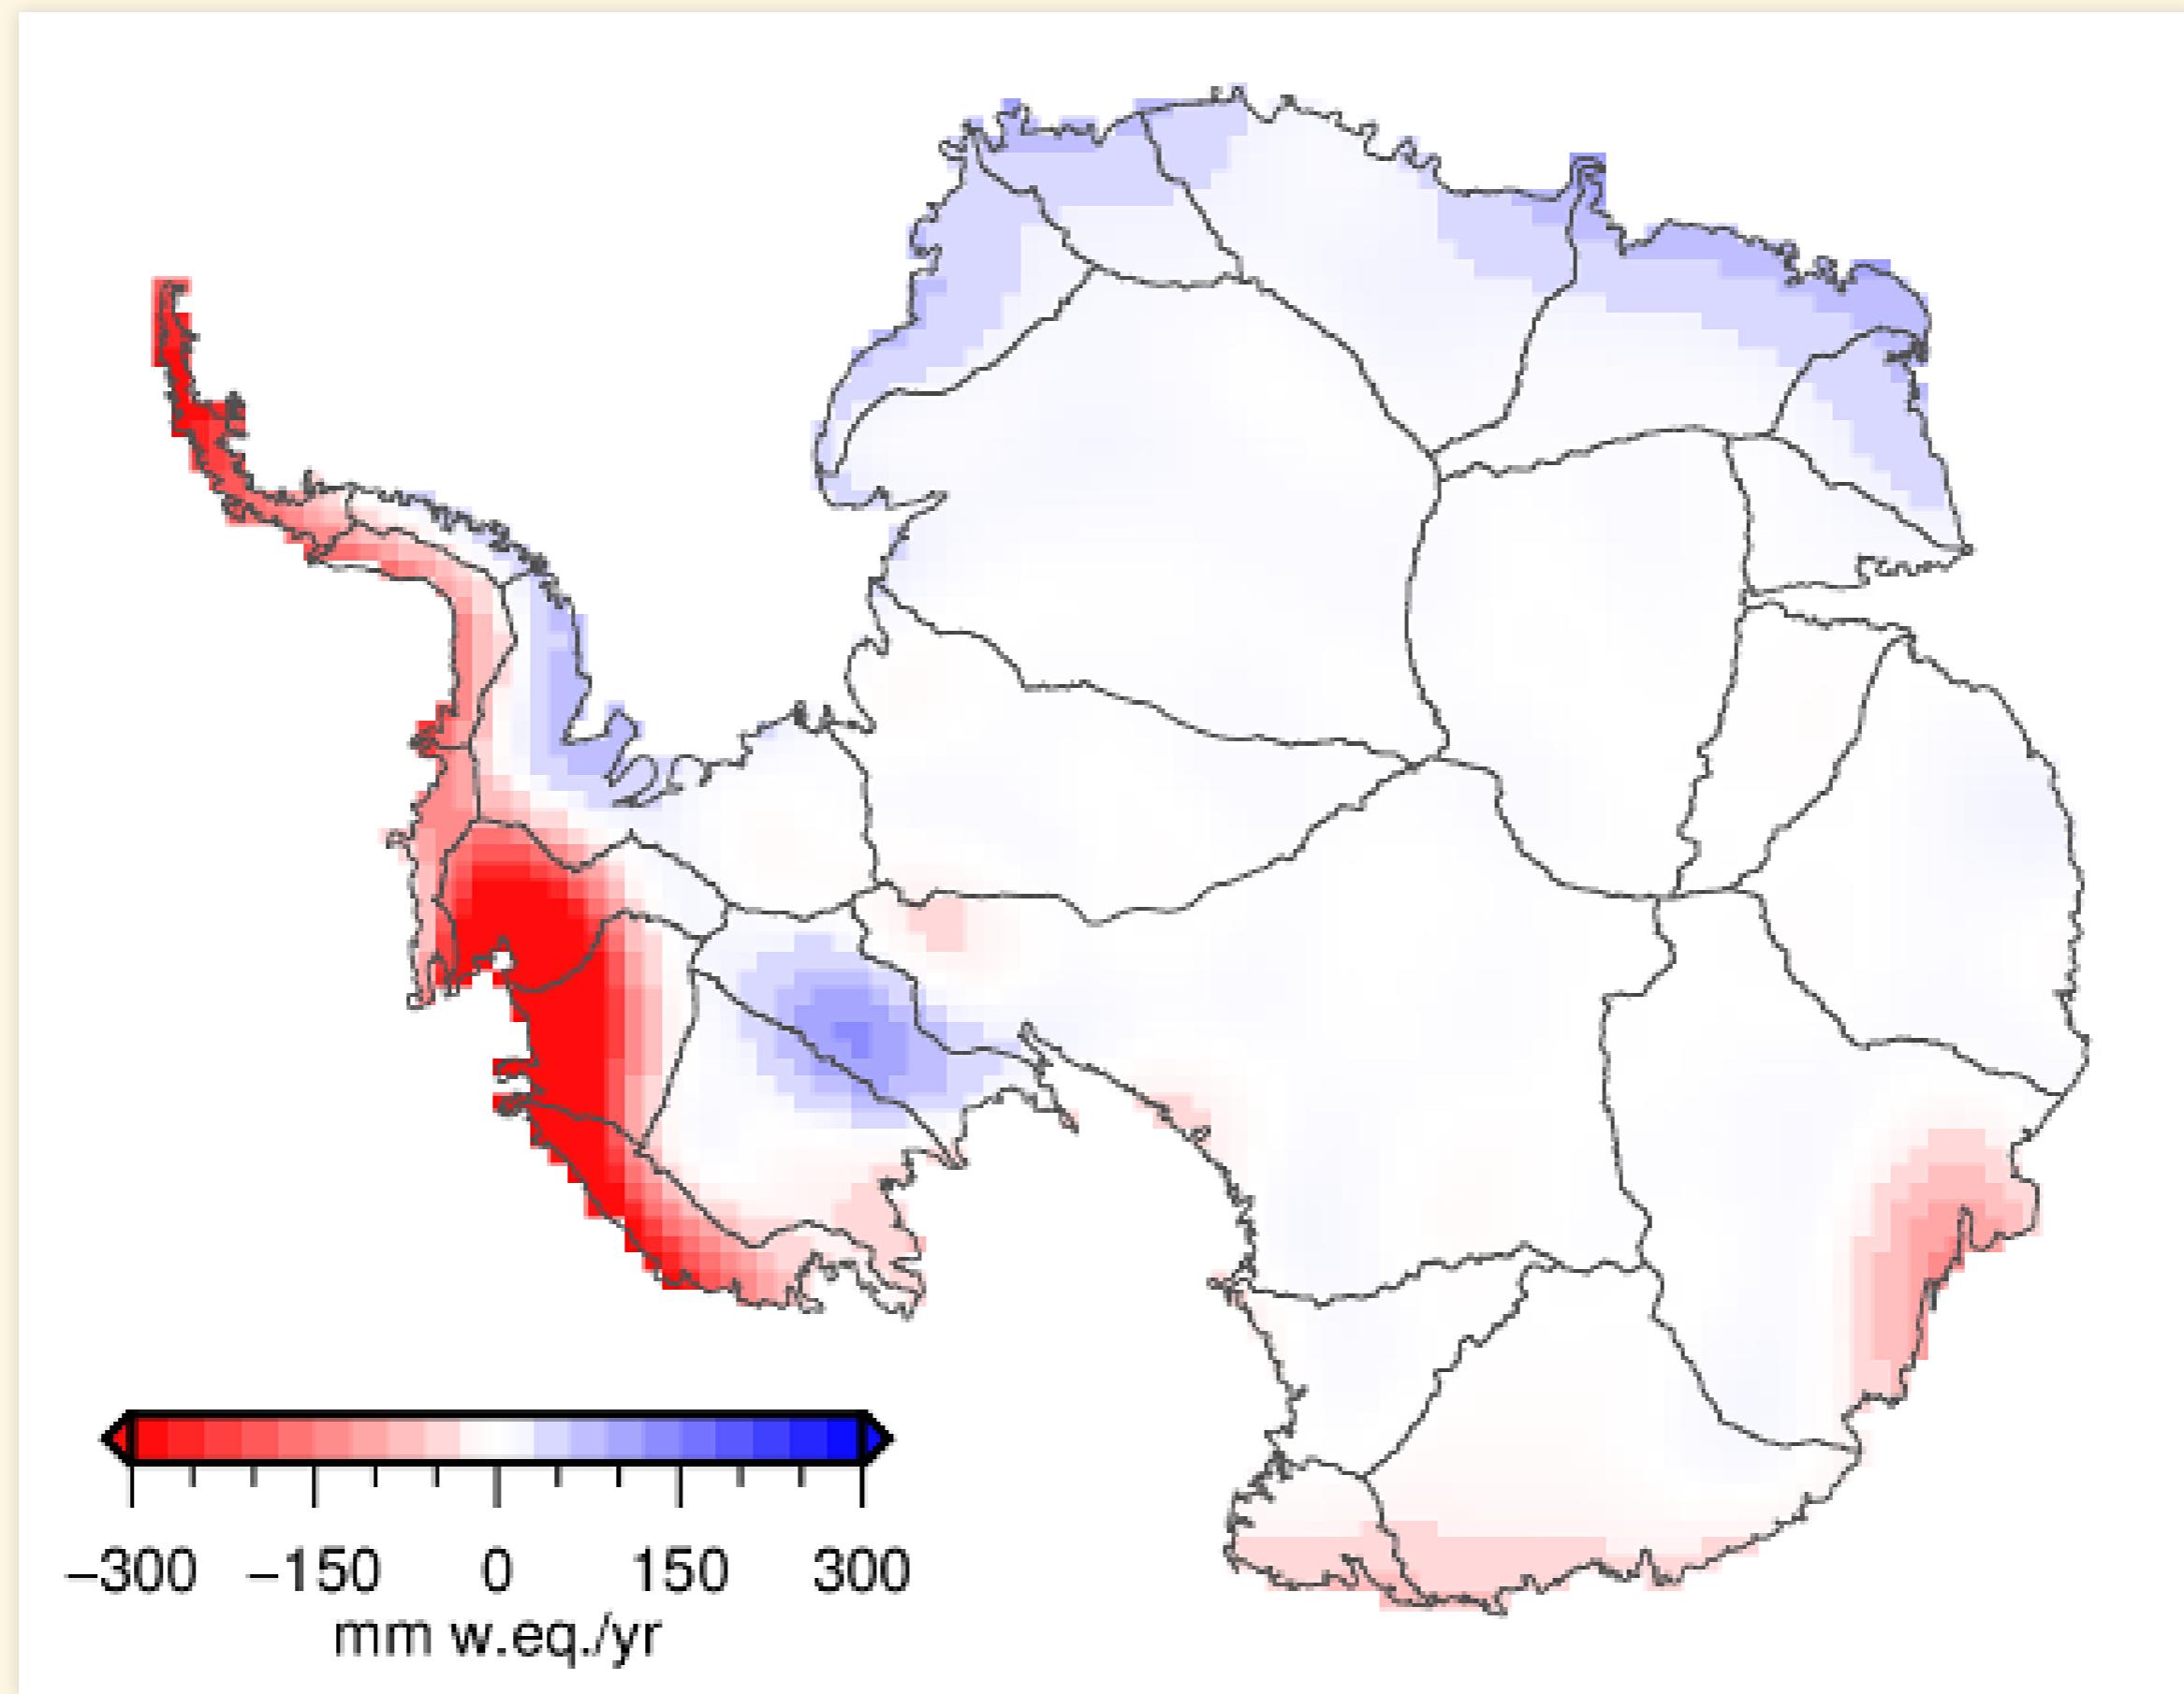

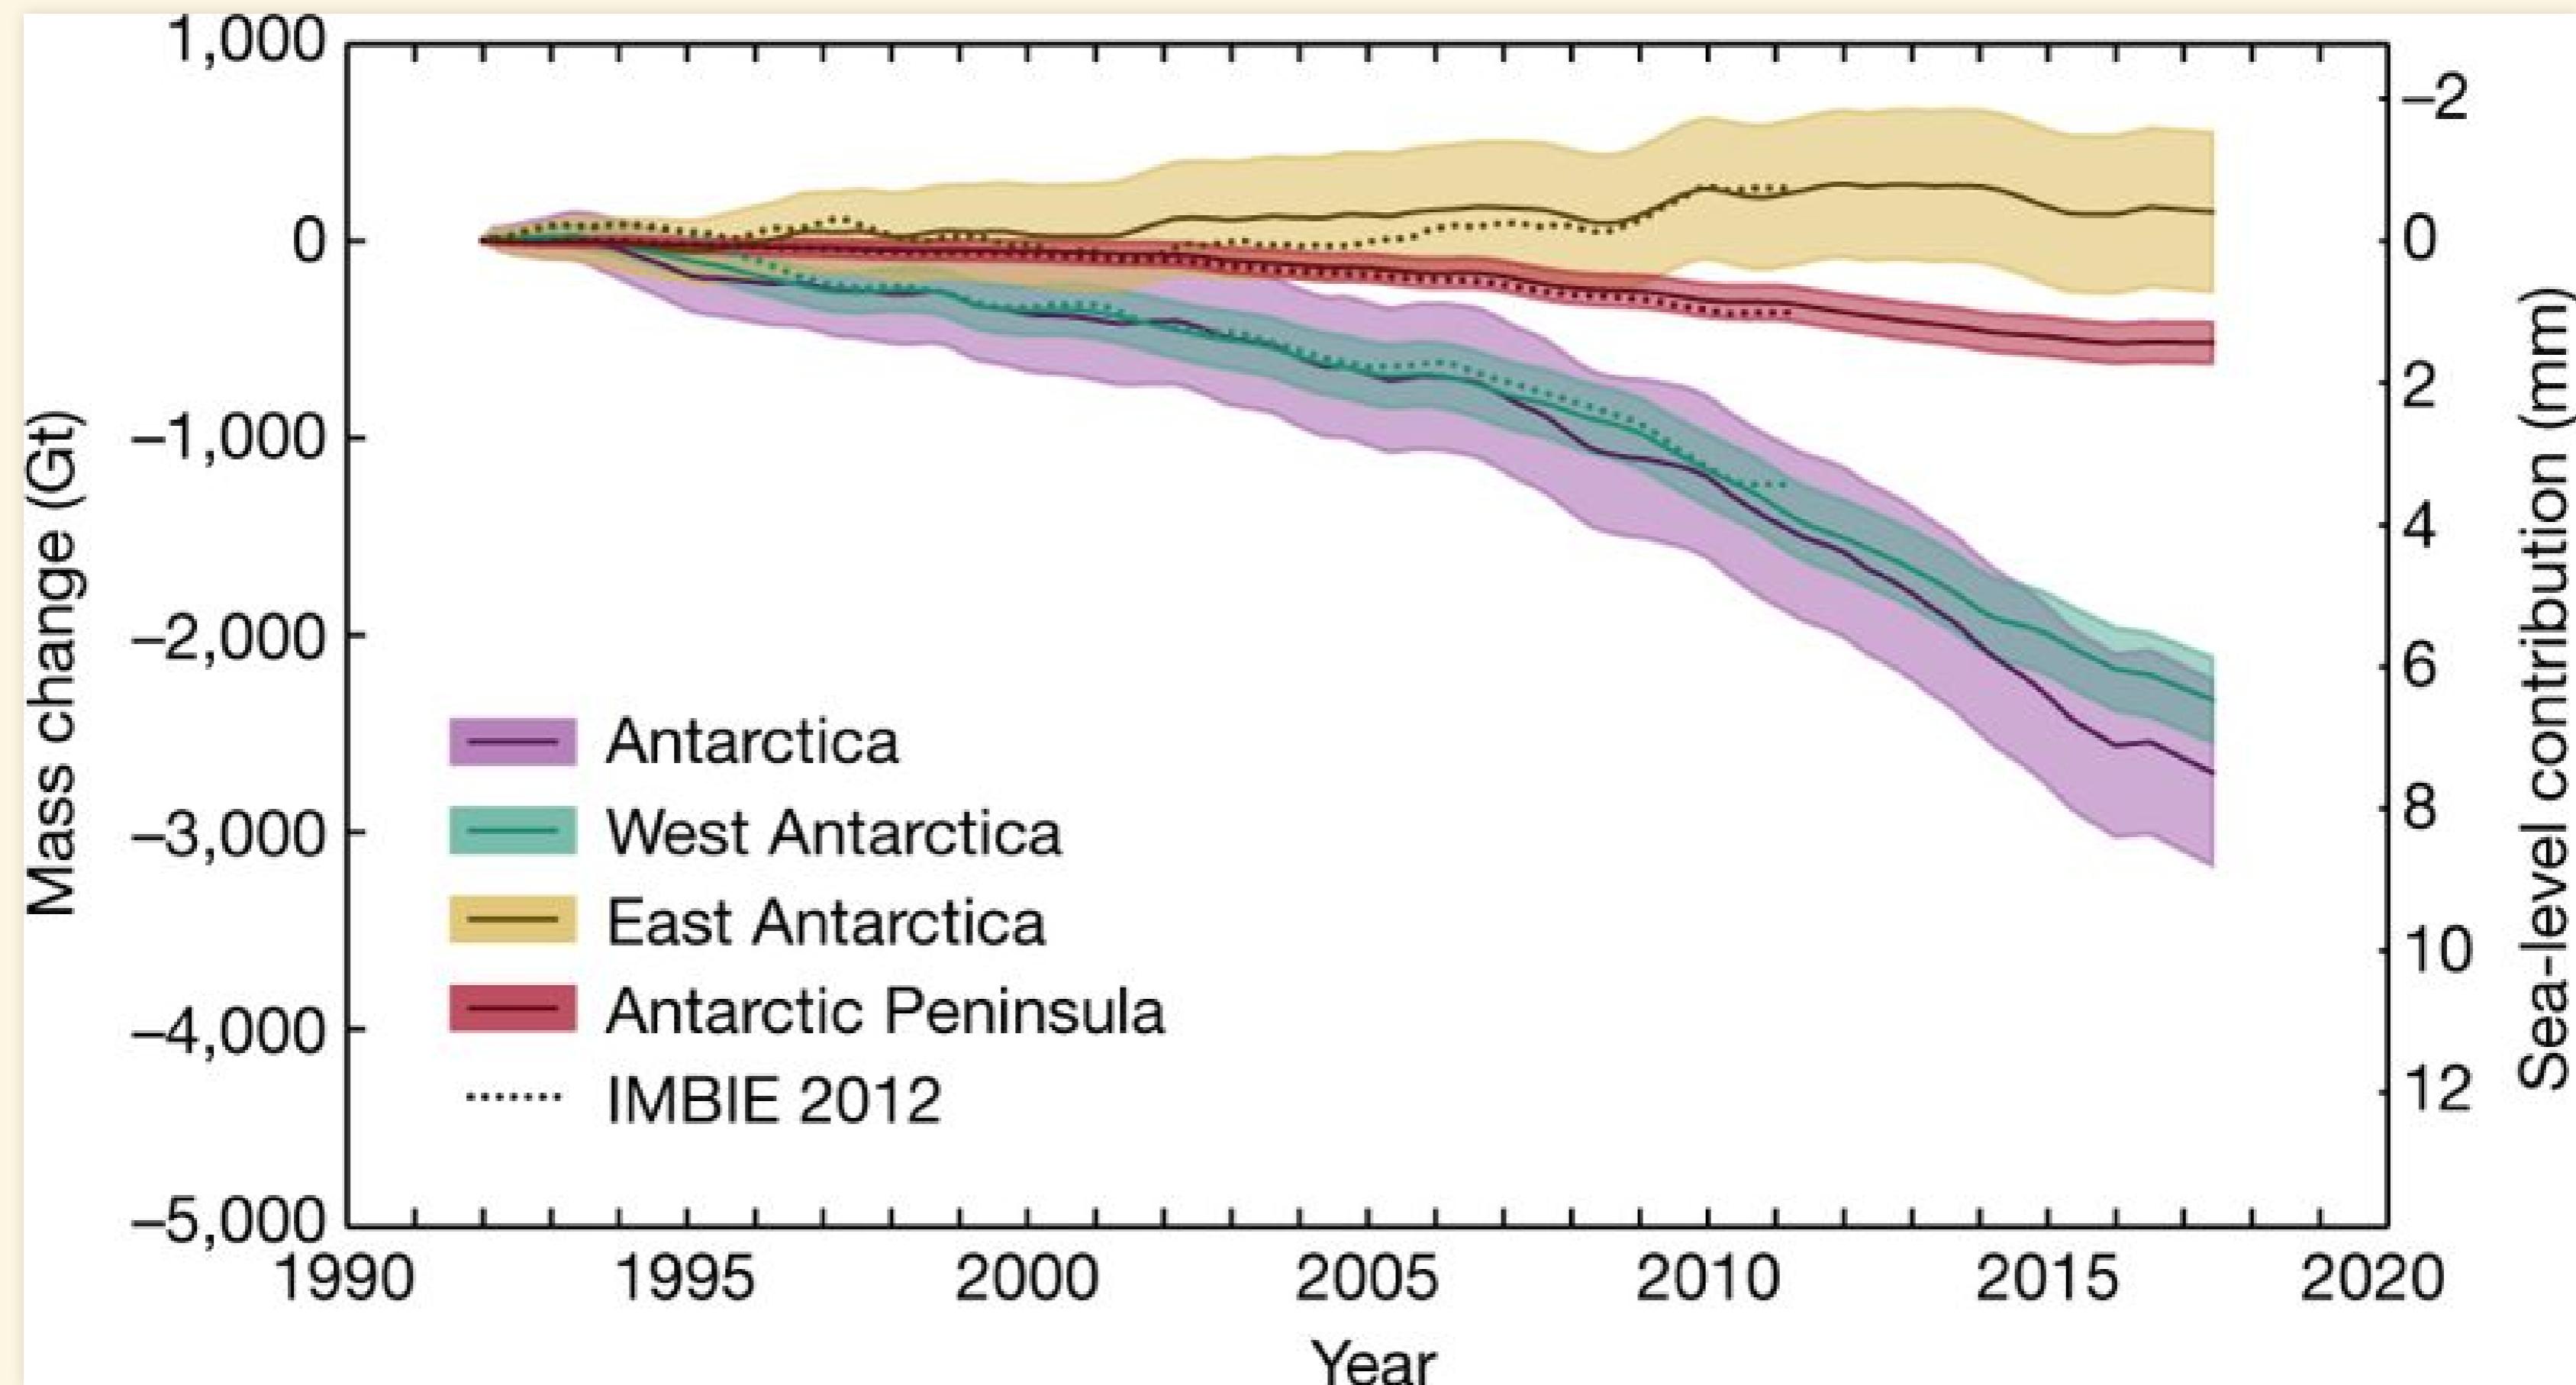

Image credit: NASA

Observations

Ice loss

GRACE Results

- Greenland melting faster than previously thought
 - Almost 150 cubic miles per year
 - Loss is accelerating
 - Melting more than 7 times faster than in 1990s.
- Antarctica is losing ice instead of gaining
 - 150 cubic miles per year

Bottom Line:

- Sea level is rising
- Hard to estimate future rise:
 - Glacier dynamics is very uncertain
- Rate matters!
 - Rapid sea-level rise makes it hard to adapt

Impacts

- Population displacement, migration
- Amplified impacts of coastal storms
- Coastal ecosystems
- World Heritage Sites

Photo credit: Soumyajit Nandy

Adaptation

- Abandon vulnerable land
- Protect valuable land
- Raise buildings
- Move inland

Photo credit: Wikipedia

Summing Up

Perspective

- Cost of cutting emissions vs. cost of adapting or living with climate change
- Extreme positions versus balanced mixture
- What about uncertainties, tipping points, and irreversibility?

End
